## François Englert and Peter W. Higgs

"for the theoretical discovery of a mechanism that contributes to our understanding of the origin of mass of subatomic particles, and which recently was confirmed through the discovery of the predicted fundamental particle, by the ATLAS and CMS experiments at CERN's Large Hadron Collider"

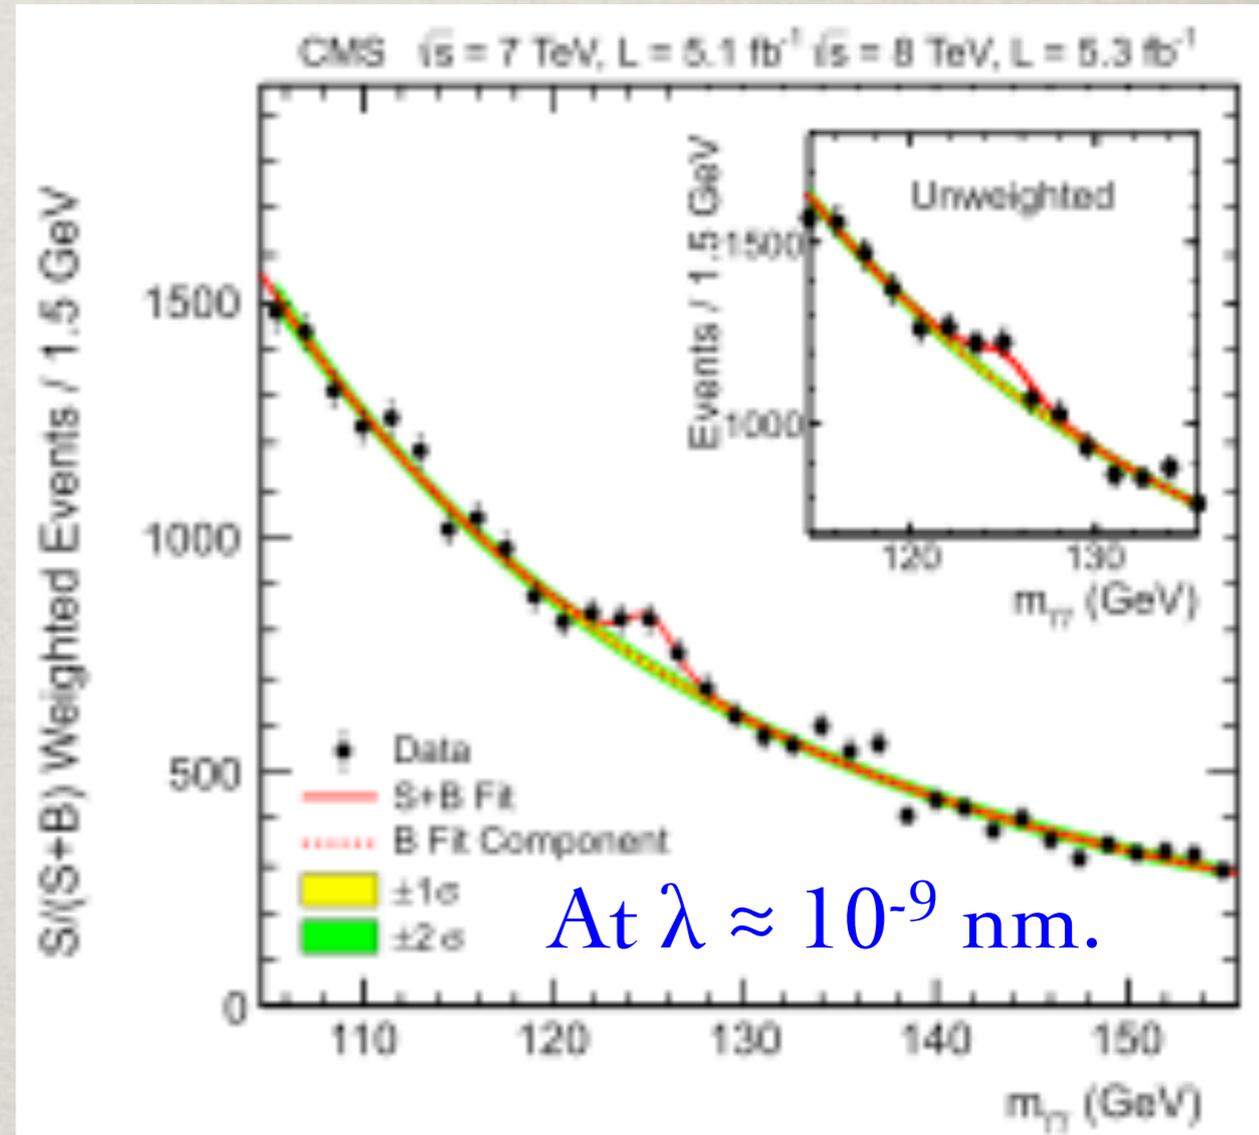

# THE DISCOVERY: July 4<sup>th</sup>, 2012: A NEUTRAL BOSON DECAY TO TWO PHOTONS

The combined signal significance:

**ATLAS:  $5.9\sigma$**

Phys. Lett. B716, 1 (2012)

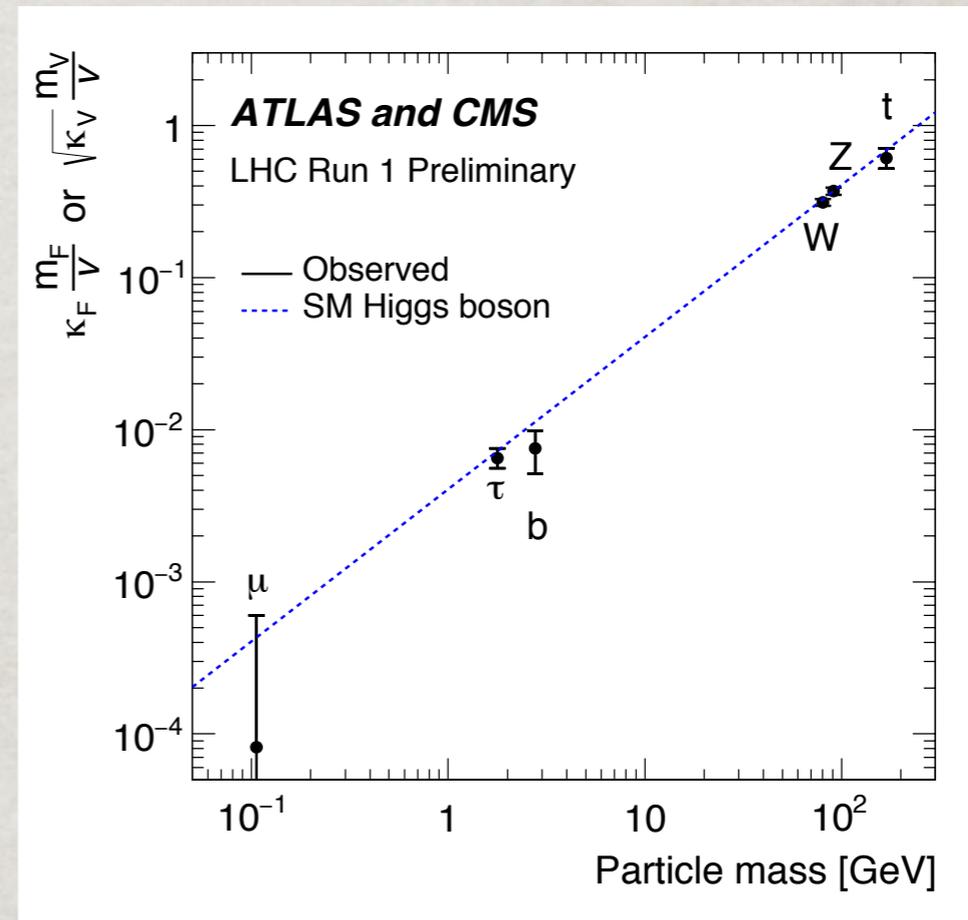

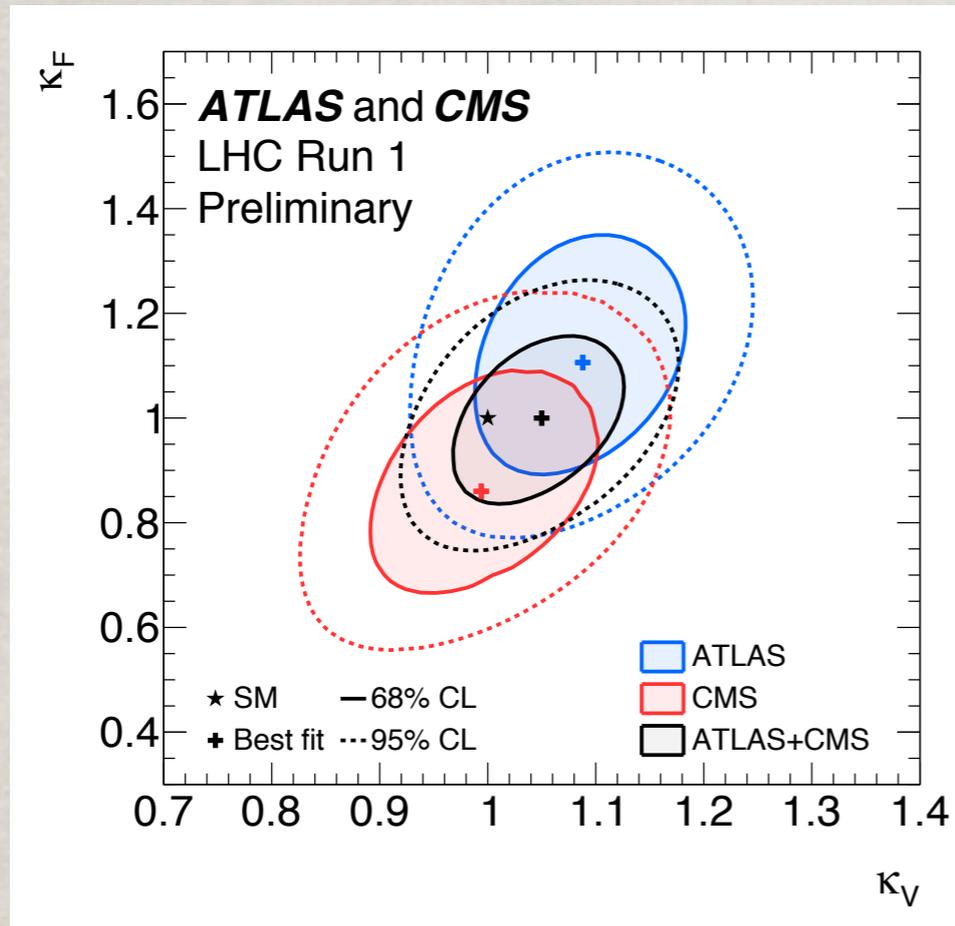

**CMS:  $5.0\sigma$**

Phys. Lett. B716, 30 (2012)

# Summer 2015 update:

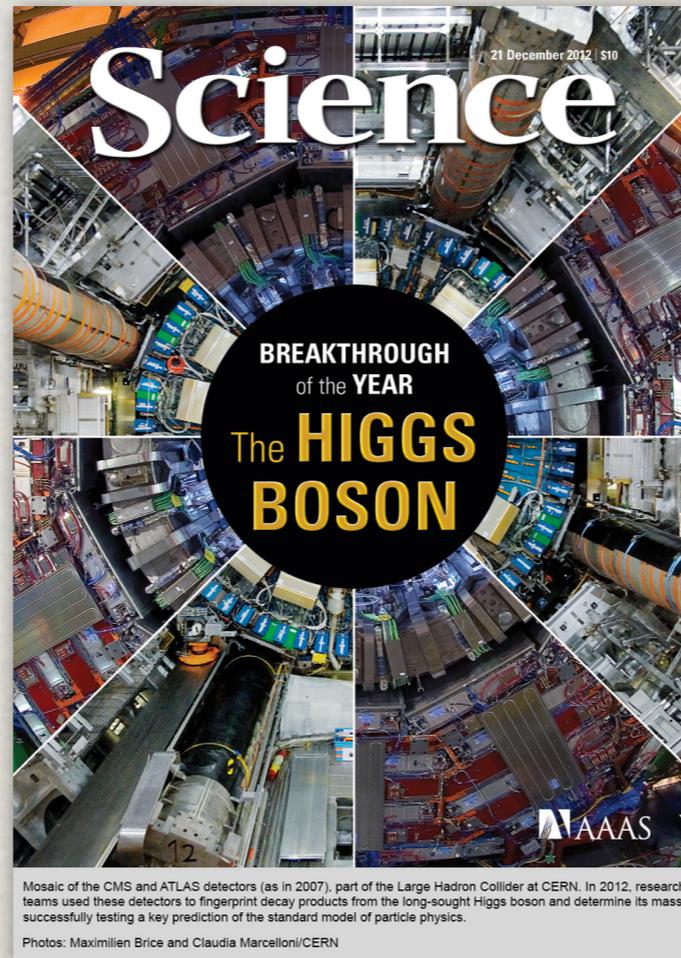

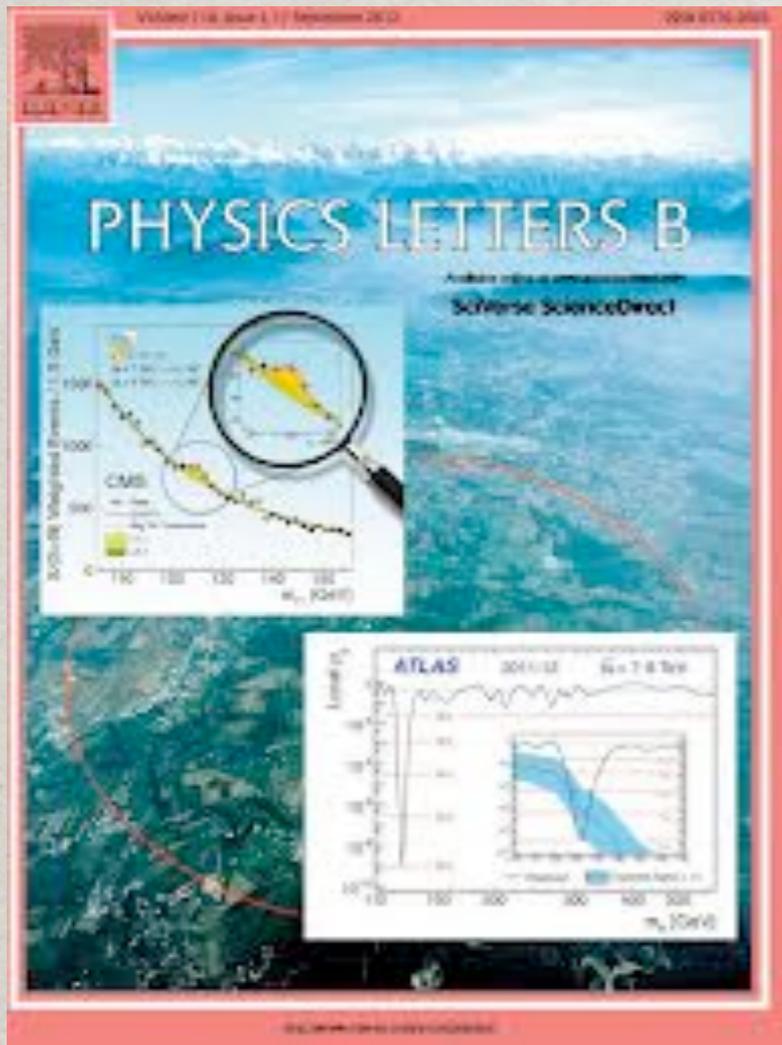

$5\sigma$  for both fermion coupling  $h \rightarrow \tau\tau$   
& bosonic coupling  $WW \rightarrow h$

- it's neutral, a boson
- it's spin-0, parity-even
- it couples to mass, non-universally

**All indications point to the SM Higgs !**

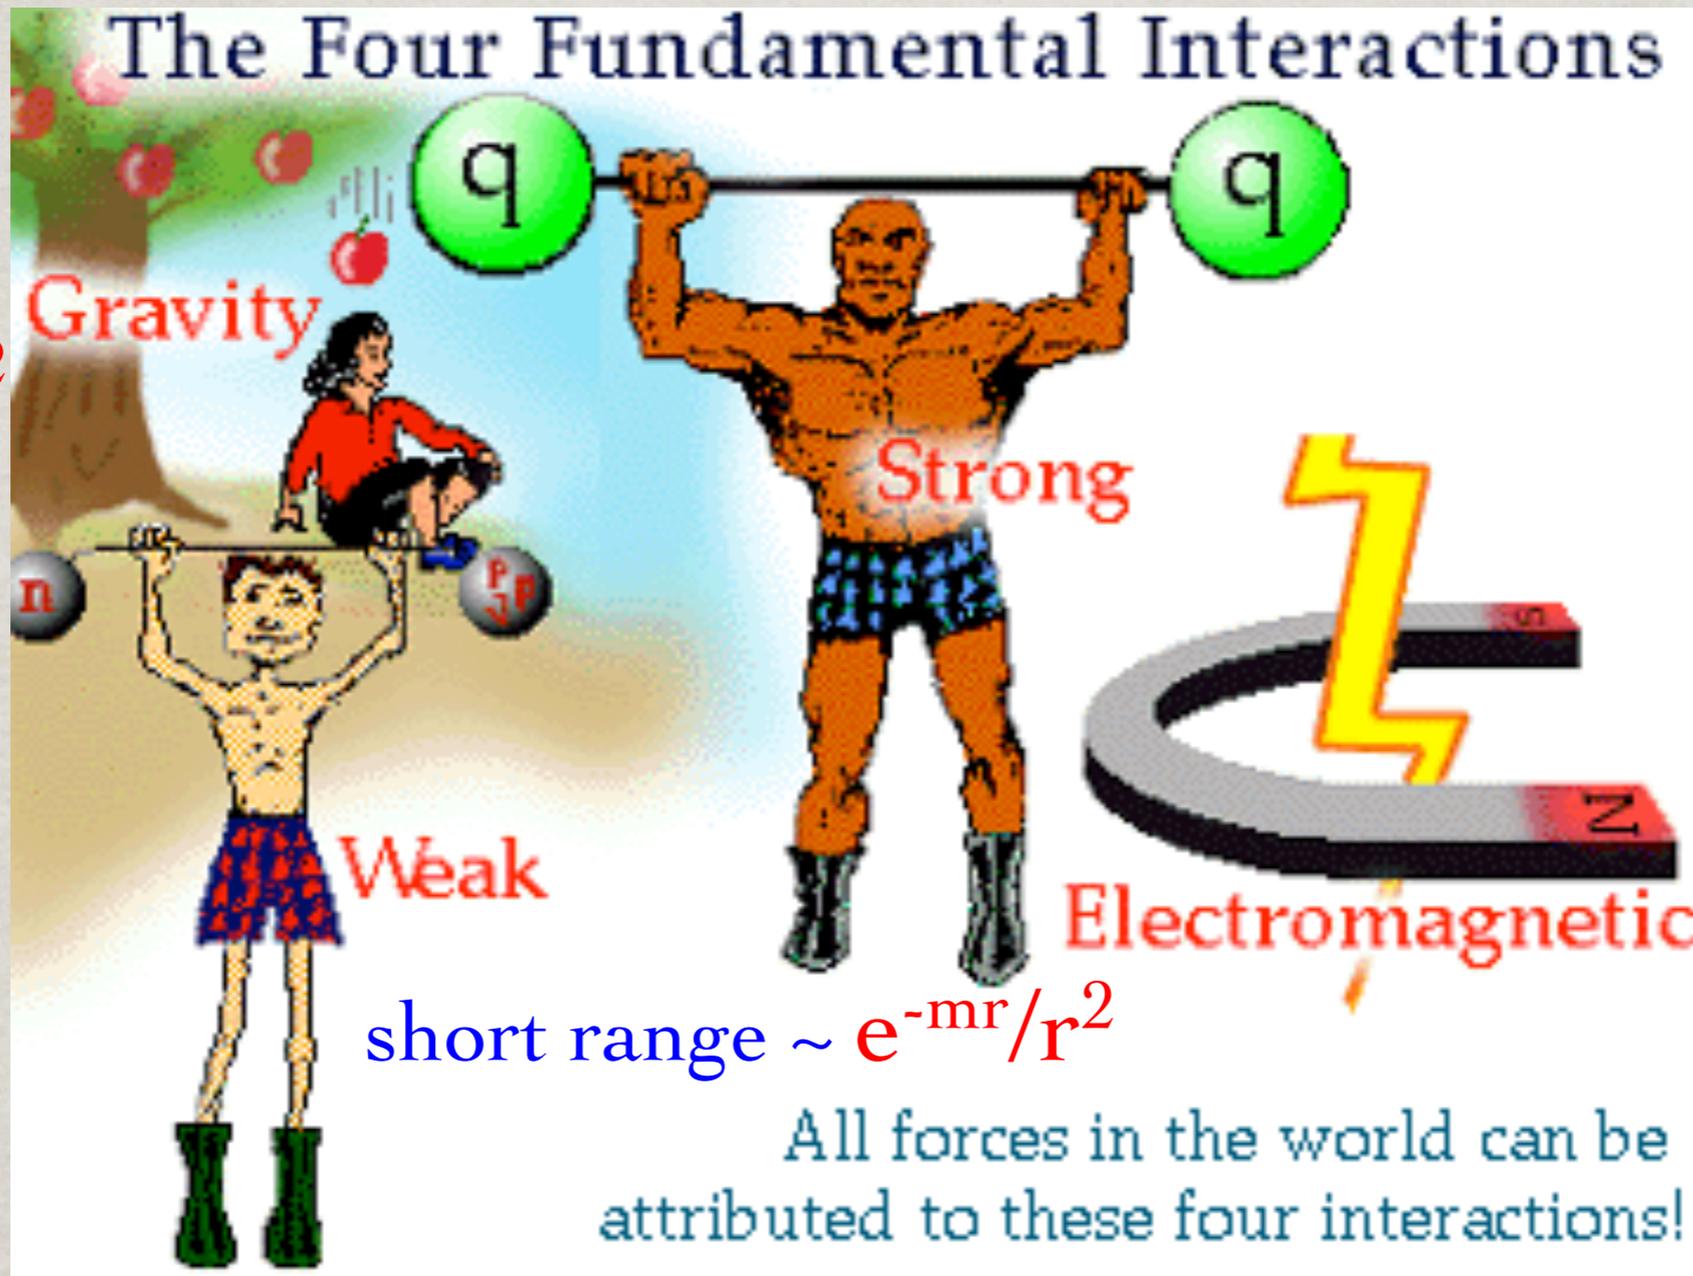

A milestone discovery:  
It is a brand new class!

*50 years theoretical work ...  
25 years experimental work ...*

*Congratulations to our CMS colleagues in Taiwan!*

# THE NATURE OF FORCES:

long range  
 $\sim (G_N m_1 m_2) / r^2$

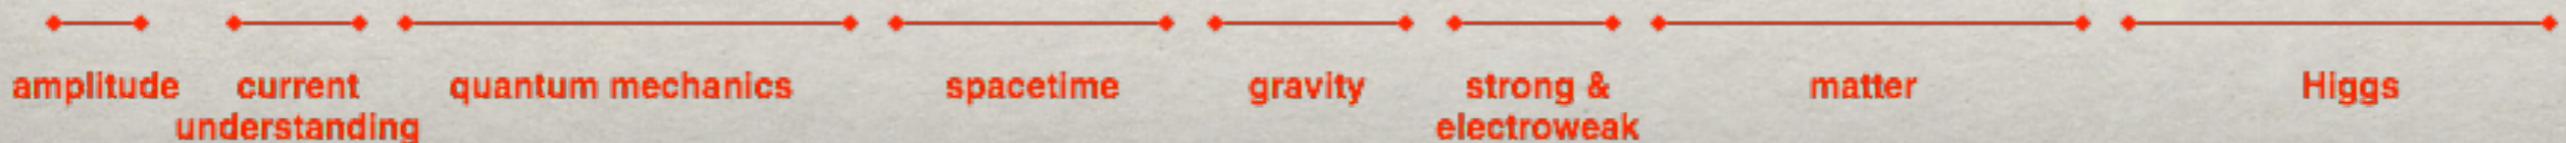

long range  
 $\sim (\alpha e_1 e_2) / r^2$

short range  $\sim e^{-mr} / r^2$

All forces in the world can be attributed to these four interactions!

## All known physics

$$W = \int_{k < \Lambda} [Dg \dots] \exp \left\{ \frac{i}{\hbar} \int d^4x \sqrt{-g} \left[ \frac{1}{16\pi G} R - \frac{1}{4} F^2 + \bar{\psi} i \not{D} \psi - \lambda \phi \bar{\psi} \psi + |D\phi|^2 - V(\phi) \right] \right\}$$

# E&M: Most Successful in Theory & Practice!

$$\mathcal{L} = \left( -\frac{1}{4} F^{\mu\nu} F_{\mu\nu} \right) + \bar{\psi} (i\gamma^\mu D_\mu - m_e) \psi$$

$$F^{\mu\nu} = \partial^\mu A^\nu - \partial^\nu A^\mu, \quad D_\mu = \partial_\mu + ieA_\mu$$

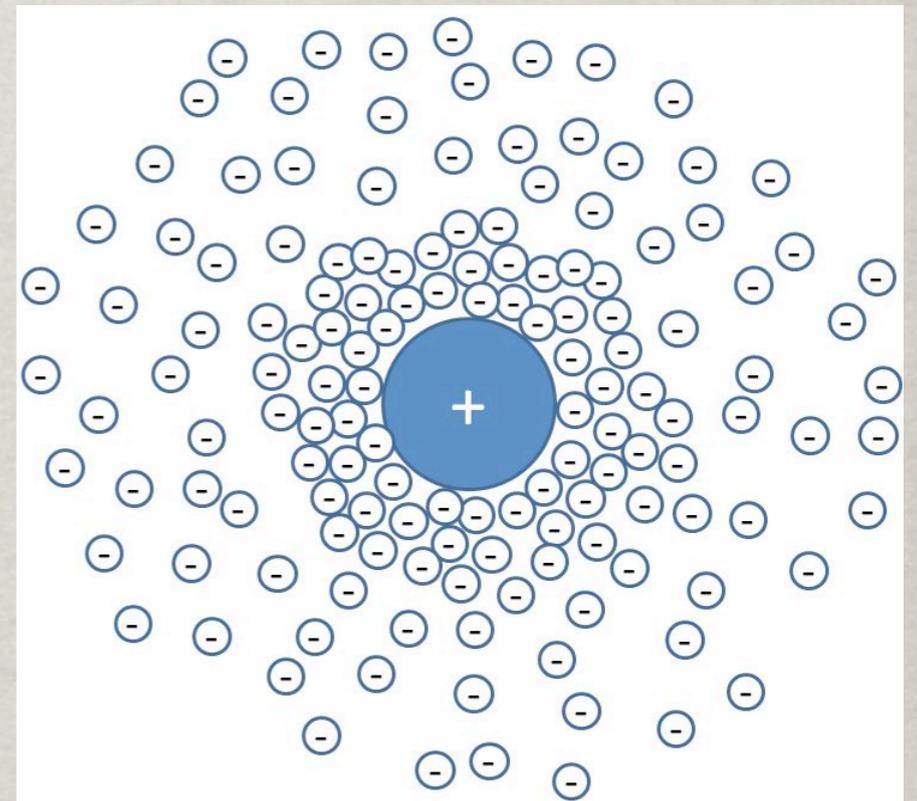

- At low energies  $\rightarrow$  Maxwell's theory; vector-like coupling by a  $U_{em}(1)$  gauge symmetry
- At high energies  $\rightarrow$  Quantum-mechanical, renormalizable, most accurate (in science!): a part of trillion

$$a_e^{theo} = 0.001159652181643(763)$$

$$a_e^{exp} = 0.00115965218073(28)$$

- QED becomes strongly interacting asymptotically (screening effects)

$$\alpha(Q^2) = \frac{\alpha(Q_0^2)}{1 - \frac{\alpha(Q_0^2)}{3\pi} \ln(Q^2/Q_0^2)}$$

At ultra-violet (UV)  $\rightarrow$  theory is invalid.

# The strong force: $SU_c(3)$ Quantum Chromo-Dynamics

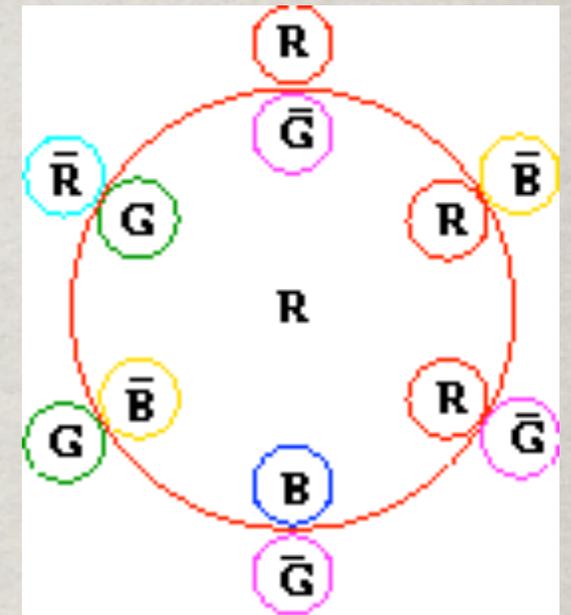

## Successful Theory, Challenging in Practice!

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu}^a F^{a\mu\nu} + \sum_f \bar{q}_f (i\gamma^\mu \partial_\mu - g_s \gamma^\mu A_\mu - m_f) q_f$$

$$F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu + ig_s [A_\mu, A_\nu]$$

$$A^\mu(x) = \sum_a^8 A(x)_a^\mu T^a, \quad [T^a, T^b] = if_{abc} T^c.$$

- At short distances/high energies  $\rightarrow$  asymptotically free (anti-screening effects)

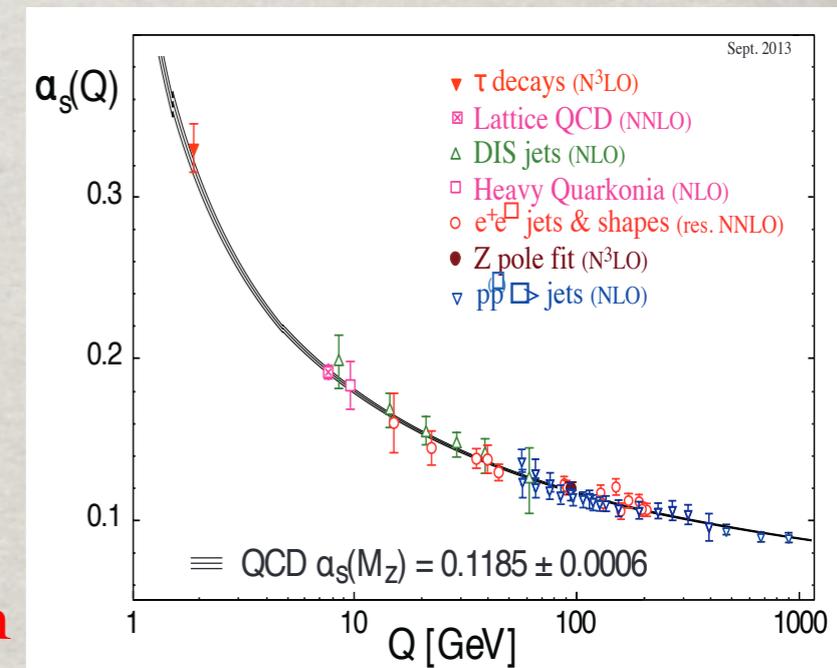

$$\alpha_s(Q^2) = \frac{12\pi}{(33 - 2n_f) \ln(Q^2/\Lambda^2)}$$

Highly predictable at high energies:  
Crucial for HEP, early Universe ...

- At long distances/low energies  $> 10^{-13}\text{cm}$   
 $\rightarrow$  Strongly interacting: quarks condensate ( $\pi^0, \pi^\pm \dots$ )  
& (colorless) hadrons ( $p^+, n$ ) formed.

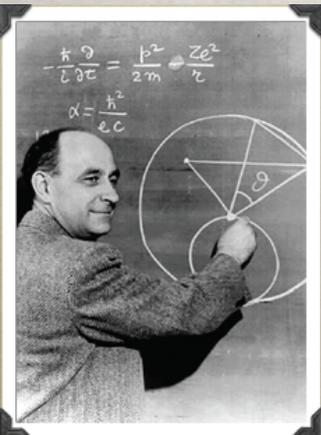

Short range force by a dynamical mass:  $e^{-m_\pi r}/r^2$

# The Weak force: Quark & Lepton Flavor Transitions

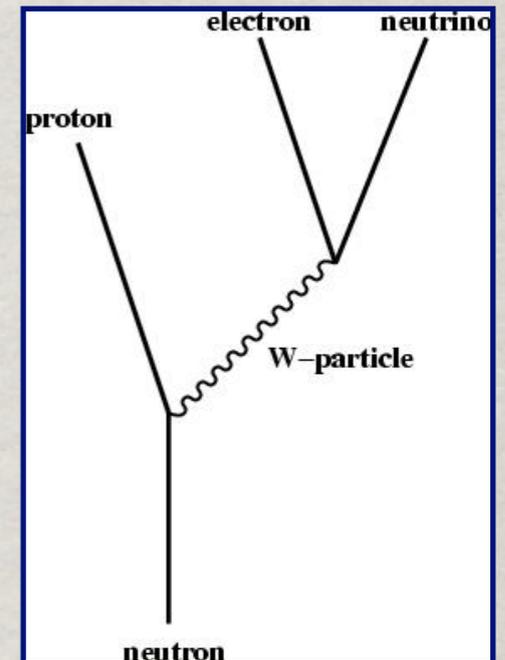

Beta decay  $n \rightarrow p^+ e^- \nu$   $\rightarrow$  Charged current interaction:  $W^\pm$

Inspired by EM current-current interactions,  
Fermi proposed (1934)

$$\mathcal{L}_{weak} = -\frac{G_F}{\sqrt{2}} J^\mu(p^+ n) J_\mu(e^- \nu)$$

force range  $\sim \sqrt{G_F} \sim M_W^{-1} \sim 10^{-18} \text{m}$

Weak interaction based on  $SU(2) \times U(1)$ : (Glashow, '63)

$$B_{\mu\nu} = \partial_\mu B_\nu - \partial_\nu B_\mu$$

$$W_{\mu\nu}^i = \partial_\mu W_\nu^i - \partial_\nu W_\mu^i - g\epsilon_{ijk} W_\mu^j W_\nu^k$$

However,

$$-\frac{g}{2\sqrt{2}} \sum_i \bar{\Psi}_i \gamma^\mu (1 - \gamma^5) (T^+ W_\mu^+ + T^- W_\mu^-) \Psi_i$$

$$-e \sum_i q_i \bar{\psi}_i \gamma^\mu \psi_i A_\mu$$

$$-\frac{g}{2 \cos \theta_W} \sum_i \bar{\psi}_i \gamma^\mu (g_V^i - g_A^i \gamma^5) \psi_i Z_\mu$$

The local gauge symmetry prevents gauge bosons masses!

$$\frac{1}{2} M_A^2 A_\mu A^\mu \rightarrow \frac{1}{2} M_A^2 (A_\mu - \frac{1}{e} \partial_\mu \alpha) (A^\mu - \frac{1}{e} \partial^\mu \alpha) \neq \frac{1}{2} M_A^2 A_\mu A^\mu$$

Pauli's rejection to the Yang-Mills theory.

# The Weak force: Quark & Lepton Flavor Transitions

Even worse:

“The Left- and right-chiral electrons carry different Weak charges” (Lee & Yang)

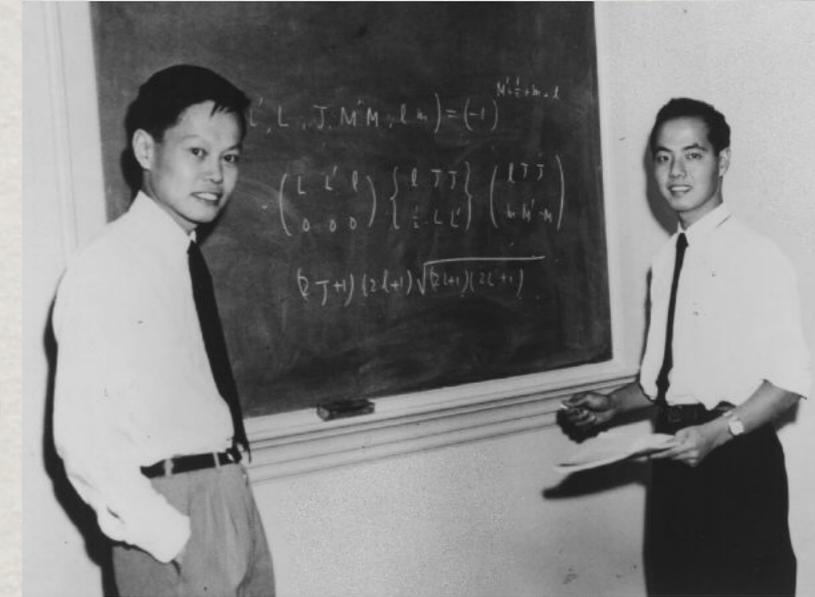

- Simple structure and particle contents:

Leptons:

$$\begin{pmatrix} \nu_e \\ e \end{pmatrix}_L, \quad \begin{pmatrix} \nu_\mu \\ \mu \end{pmatrix}_L, \quad \begin{pmatrix} \nu_\tau \\ \tau \end{pmatrix}_L, \quad e_R, \mu_R, \tau_R, \quad (\nu'_R \text{ s ?})$$

Quarks:

$$\begin{pmatrix} u \\ d \end{pmatrix}_L, \quad \begin{pmatrix} c \\ s \end{pmatrix}_L, \quad \begin{pmatrix} t \\ b \end{pmatrix}_L, \quad u_R, d_R, c_R, s_R, t_R, b_R$$

Fermion masses also forbidden by gauge symmetry!

$$-m_e \bar{e}e = -m_e \bar{e} \left( \frac{1}{2}(1 - \gamma_5) + \frac{1}{2}(1 + \gamma_5) \right) e = -m_e (\bar{e}_R e_L + \bar{e}_L e_R)$$

Electroweak gauge theory  $\rightarrow$  massless!

# THE SPONTANEOUS SYMMETRY BREAKING

“ The Lagrangian of the system may display an symmetry, but the ground state does not respect the same symmetry.”

## Known Example: Ferromagnetism

Above a critical temperature, the system is symmetric, magnetic dipoles randomly oriented. Below a critical temperature, the ground state is a completely ordered configuration in which all dipoles are ordered in some arbitrary direction

$$SO(3) \rightarrow SO(2)$$

Domains Before Magnetization

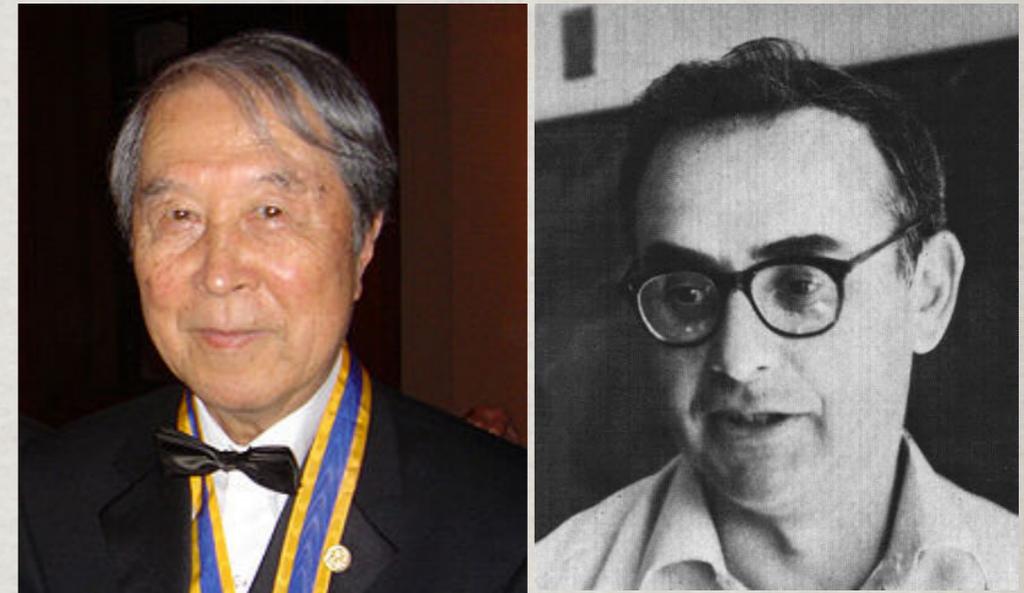

Domains After Magnetization

Low temperature super-conductivity is another example!

The concept of SSB: profound, common.

# THE NAMBU-GOLDSTONE THEOREM

“If a continuous symmetry of the system is spontaneously broken, then there will appear a massless degree of freedom, called the Nambu-Goldstone boson.”

Except the photon, no massless boson  
(a long-range force carrier) has been seen in Nature!

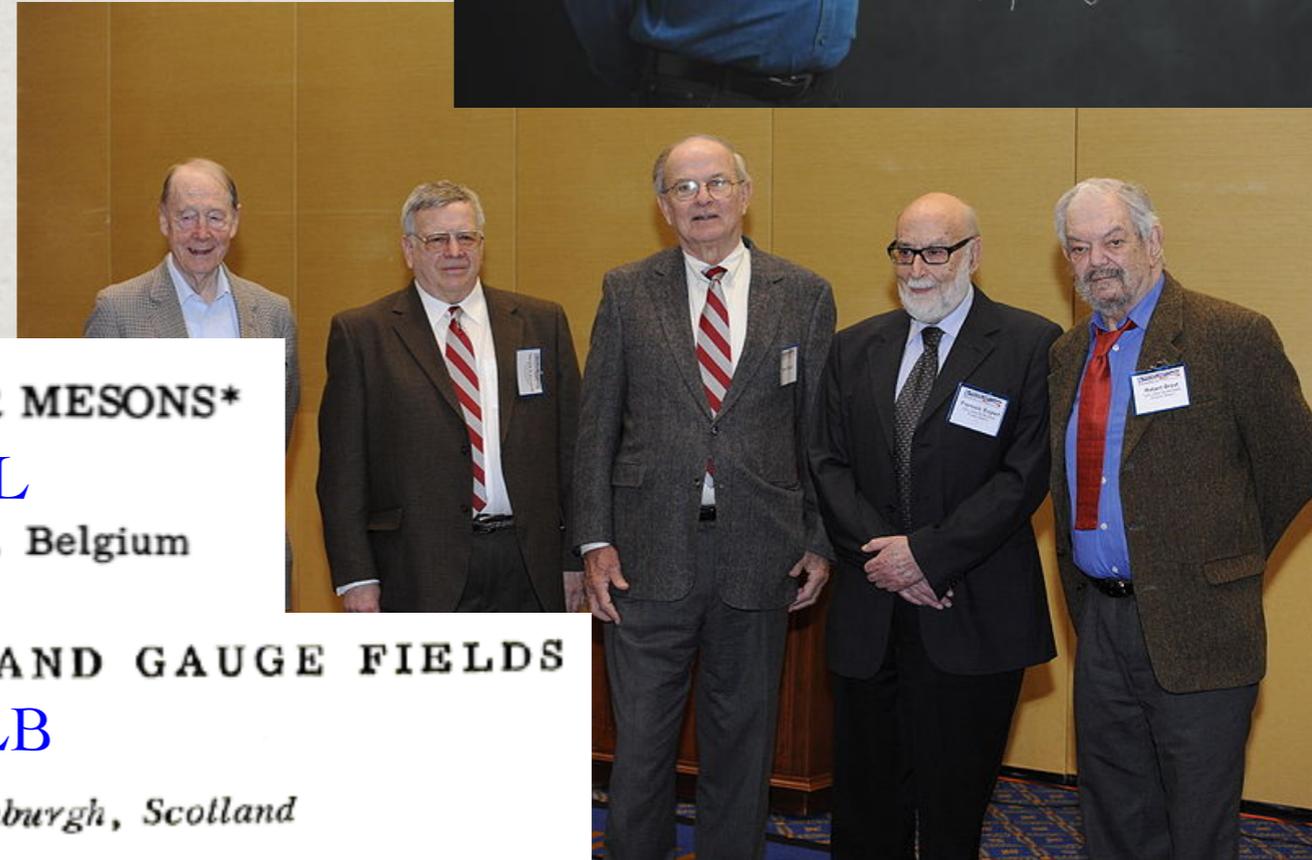

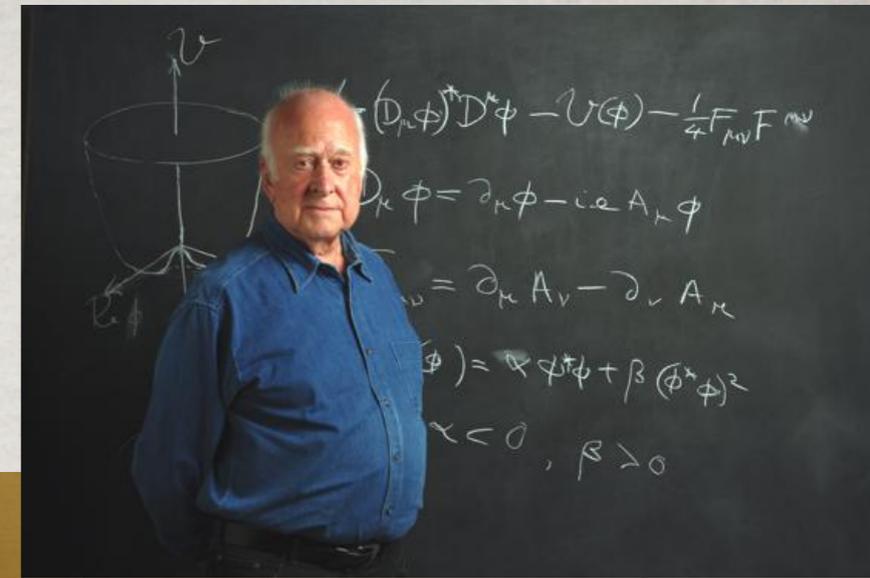

(Recall Pauli's criticism)

The Spontaneous Symmetry Breaking:  
Brilliant idea & common phenomena, confronts  
the Nambu-Goldstone theorem!

-- A show stopper ?

# THE HIGGS MECHANISM: THE MAGIC IN 1964

“If a LOCAL gauge symmetry is spontaneously broken, then the gauge boson acquires a mass by absorbing the Goldstone mode.”

Department of Physics, Imperial College, London, England

(Received 12 October 1964)

# An illustrative (original) Model:¶

$$\mathcal{L} = |\mathcal{D}^\mu \phi|^2 - \mu^2 |\phi|^2 - |\lambda| (\phi^* \phi)^2 - \frac{1}{4} F_{\mu\nu} F^{\mu\nu},$$

where

$$\phi = \frac{\phi_1 + i\phi_2}{\sqrt{2}}$$

is a complex scalar field<sup>4</sup> and as usual

$$\mathcal{D}_\mu \equiv \partial_\mu + iqA_\mu$$

and

$$F_{\mu\nu} \equiv \partial_\nu A_\mu - \partial_\mu A_\nu.$$

The Lagrangian (5.3.1) is invariant under U(1) rotations

$$\phi \rightarrow \phi' = e^{i\theta} \phi$$

and under the local gauge transformations

$$\begin{aligned} \phi(x) &\rightarrow \phi'(x) = e^{iq\alpha(x)} \phi(x), \\ A_\mu(x) &\rightarrow A'_\mu(x) = A_\mu(x) - \partial_\mu \alpha(x). \end{aligned}$$

¶ C. Quigg, Gauge Theories of the Strong ...

# An illustrative (original) Model:¶

After the EWSB, parameterized in terms of

$$\langle \phi \rangle_0 = v/\sqrt{2}, \quad \phi = e^{i\zeta/v} (v + \eta)/\sqrt{2} \\ \approx (v + \eta + i\zeta)/\sqrt{2}.$$

Then the Lagrangian appropriate for the study of small oscillations is

$$\mathcal{L}_{\text{so}} = \frac{1}{2}[(\partial_\mu \eta)(\partial^\mu \eta) + 2\mu^2 \eta^2] + \frac{1}{2}[(\partial_\mu \zeta)(\partial^\mu \zeta)] \\ - \frac{1}{4}F_{\mu\nu}F^{\mu\nu} + \underline{qvA_\mu(\partial^\mu \zeta)} + \frac{q^2 v^2}{2}A_\mu A^\mu + \dots$$

The gauge field acquires a mass, mixes with the Goldstone boson.

Upon diagonalization:  $\frac{q^2 v^2}{2} \left( A_\mu + \frac{1}{qv} \partial_\mu \zeta \right) \left( A^\mu + \frac{1}{qv} \partial^\mu \zeta \right),$

a form that pleads for the gauge transformation

$$A_\mu \rightarrow A'_\mu = A_\mu + \frac{1}{qv} \partial^\mu \zeta,$$

which corresponds to the phase rotation on the scalar field

$$\phi \rightarrow \phi' = e^{-i\zeta(x)/v} \phi(x) = (v + \eta)/\sqrt{2}.$$

the resultant Lagrangian is then:

$$\mathcal{L}_{\text{so}} = \frac{1}{2}[(\partial_\mu \eta)(\partial^\mu \eta) + 2\mu^2 \eta^2] - \frac{1}{4}F_{\mu\nu}F^{\mu\nu} + \frac{q^2 v^2}{2}A'_\mu A'^\mu$$

- an  $\eta$ -field, with  $(\text{mass})^2 = -2\mu^2 > 0$ ; the Higgs boson!
  - a massive vector field  $A'_\mu$ , with mass =  $qv$
  - no  $\zeta$ -field.
- By virtue of a gauge choice - **the unitary gauge**, the  $\zeta$ -field disappears in the spectrum: a massless photon “swallowed” the massless NG boson!

Degrees of freedom count:

Before EWSB:

After:

2 (scalar)+2 (gauge pol.); 1 (scalar)+3 (gauge pol.)

- Two problems provide cure for each other!  
massless gauge boson + massless NG boson  
→ massive gauge boson + no NG boson

This is truly remarkable!

# A FEW OBSERVATIONS

## A. The Higgs mechanism $\neq$ a Higgs boson !

From theoretical point of view,

3 Nambu-Goldstone bosons were all we need!

A non-linear realization of the gauge symmetry:

$$U = \exp\{i\omega^i \tau^i / v\}, \quad D_\mu U = \partial_\mu U + igW_\mu^i \frac{\tau^i}{2} U - ig' U B_\mu \frac{\tau^3}{2}$$

$$\mathcal{L} = \frac{v^2}{2} [D^\mu U^\dagger D_\mu U] \rightarrow \frac{v^2}{4} \left( \sum_i g^2 W_i^2 + g'^2 B^2 \right)$$

The theory is valid to a unitarity bound  $\sim 2 \text{ TeV}$

The existence of a light, weakly coupled Higgs boson carries important message for our understanding & theoretical formulation

in & beyond the SM –

UV completion / renormalizability .

## B. $\lambda$ : a “New Force”

The Higgs potential:  $V = -\mu^2 |\phi|^2 + \lambda |\phi|^4$

It represents a weakly coupled new force (a fifth force):

- In the SM,  $\lambda$  is a free parameter, now measured:  
 $\lambda = m_H^2 / 2v^2 \approx 0.13$

Is it fundamental or induced?

- In SUSY, it is related to the gauge couplings tree-level:  $\lambda = (g_L^2 + g_Y^2)/8 \approx 0.3/4 \leftarrow$  a bit too small
- In composite/strong dynamics, harder to make  $\lambda$  big enough.

(due to the loop suppression by design)

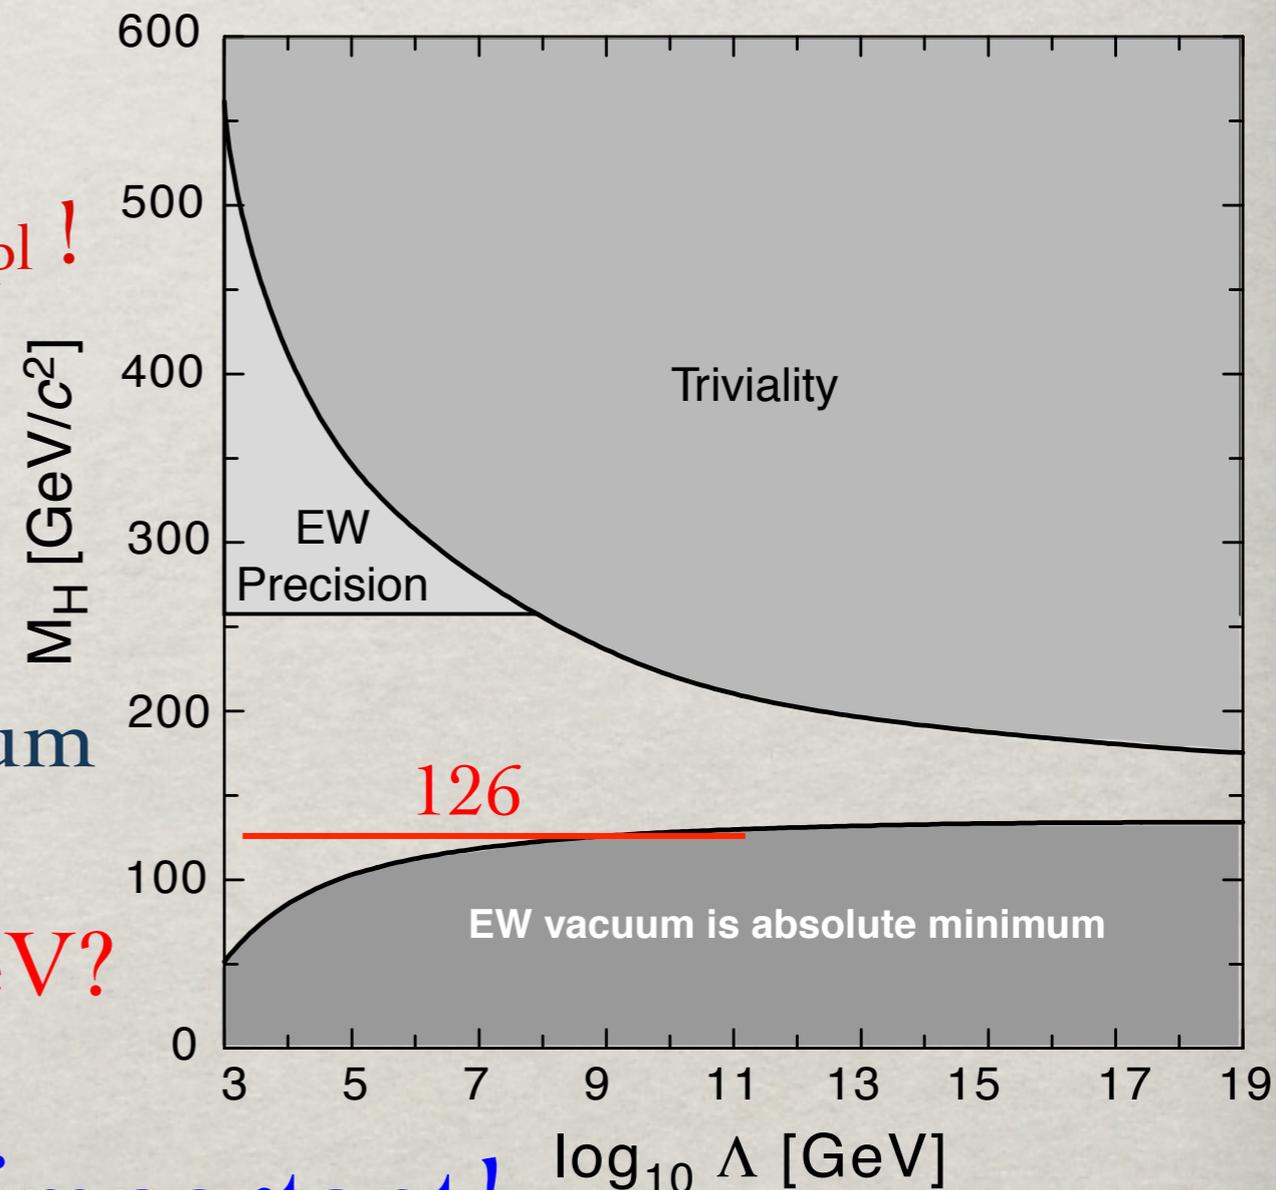

Already possess challenge to BSM theories.

At higher energies,  $\lambda$  is NOT asymptotically free.  
It blows up at a high-energy scale (the Landau pole),  
unless it starts from small (or zero  $\rightarrow$  triviality).

For  $m_H = 126$  GeV, rather light:

The SM can be a consistent  
perturbative theory up to  $M_{pl}$ !  
allowing  $M_N, M_{GUT}, \dots$

Top-Yukawa drags the vacuum  
meta-stable,  
New physics below  $10^7-11$  GeV?

The new coupling  $\lambda$  very important!

# C. Electroweak Super-Conductivity

Normal phase  $\Rightarrow$

$E^2 = p^2 c^2$

Long-range force

$T > T_c$        $T < T_c$

$\Leftarrow$  Superconducting phase

$E^2 = p^2 c^2 + m^2 c^4$

gap leads to  $\sim \exp(-r/\lambda)$

$\lambda \sim m^{-1}$  penetration depth

In “conventional” electro-magnetic superconductivity:

$m_\gamma \sim m_e/1000, T_c^{em} \sim \mathcal{O}(\text{few } K).$  BCS theory.

In “electro-weak superconductivity”:

$m_w \sim G_F^{-\frac{1}{2}} \sim 100 \text{ GeV}, T_c^w \sim 10^{15} K!$

The Higgs potential is of the Landau-Ginsburgh form,  
but it represents a new fundamental interaction.

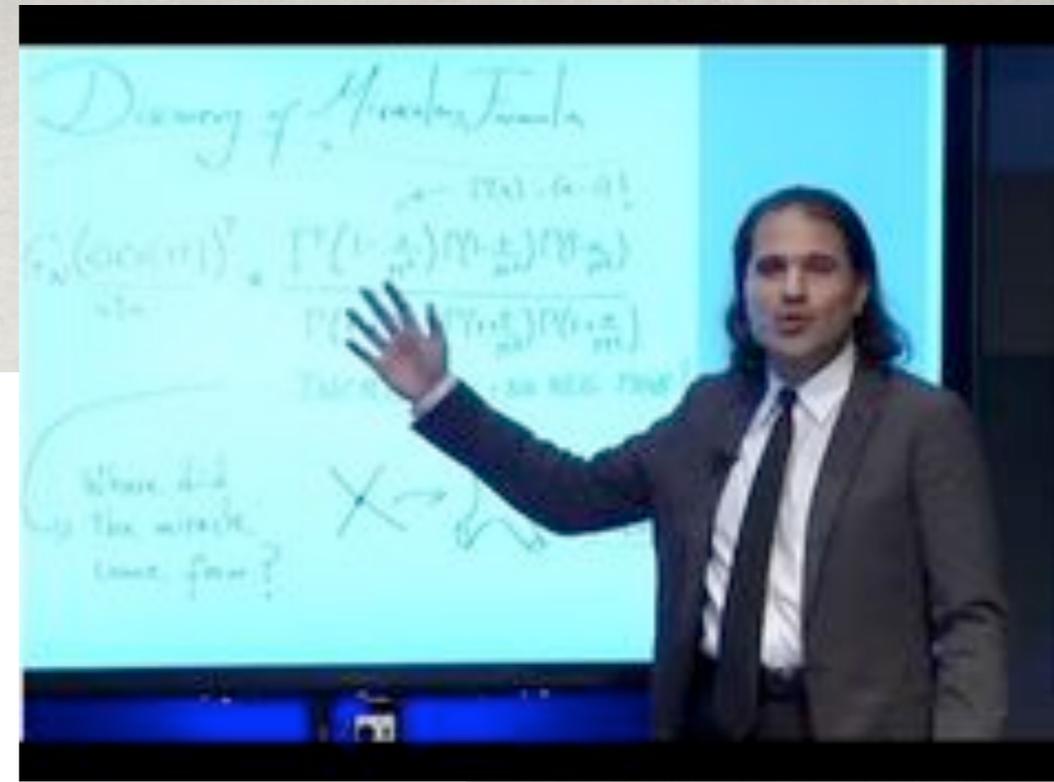

“... most of the grand underlying principles have been firmly established. An eminent physicist remarked that the future truths of physical science are to be looked for in the sixth place of decimals. ”

--- **Albert Michelson (1894)**

Michelson–Morley experiments (1887):  
“the moving-off point for the theoretical aspects  
of the second scientific revolution”

**Will History repeat itself (soon)?**

Nima Arkani-Hamed  
(Director of CFHEP, Beijing)

The central questions  
today are not details —  
but structural: origin of  
spacetime, UV/IR connection,  
standard model  $\rightarrow$  real theory

# ***NEW ERA: UNDER THE HIGGS LAMP POST***

The “Observation” papers:  
Now 3600 cites each!

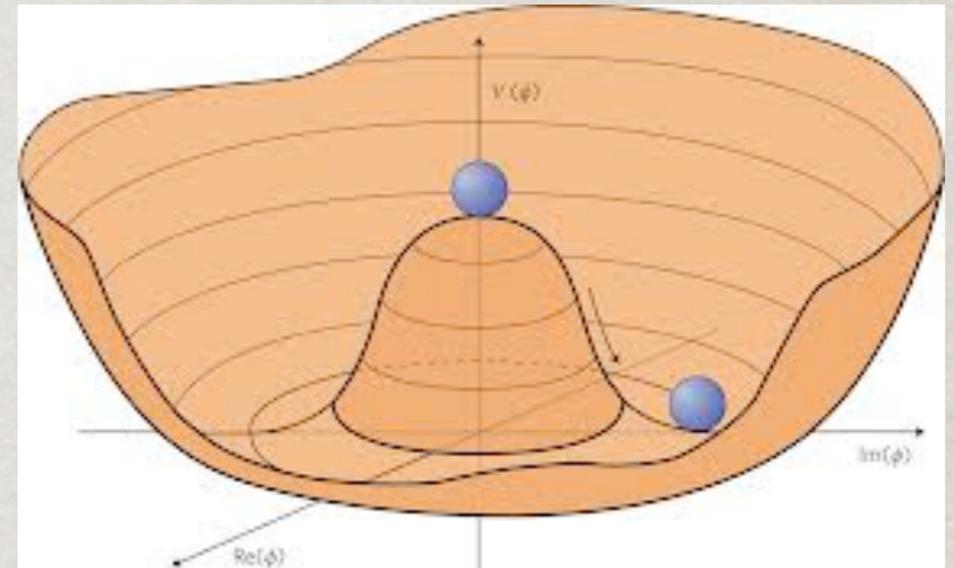

Vast scope of topics, from  
*interpretations, explorations in  $e^3$  beyond the SM;*  
*applications in astronomy, cosmology, CC; strings/branes,*  
*to “Philosophical Perspectives ....”*

# Question 1: The Nature of EWSB ?

In the SM:

$$V(|\Phi|) = -\mu^2 \Phi^\dagger \Phi + \lambda (\Phi^\dagger \Phi)^2$$
$$\Rightarrow \mu^2 H^2 + \lambda v H^3 + \frac{\lambda}{4} H^4$$

Fully determined at the weak scale:

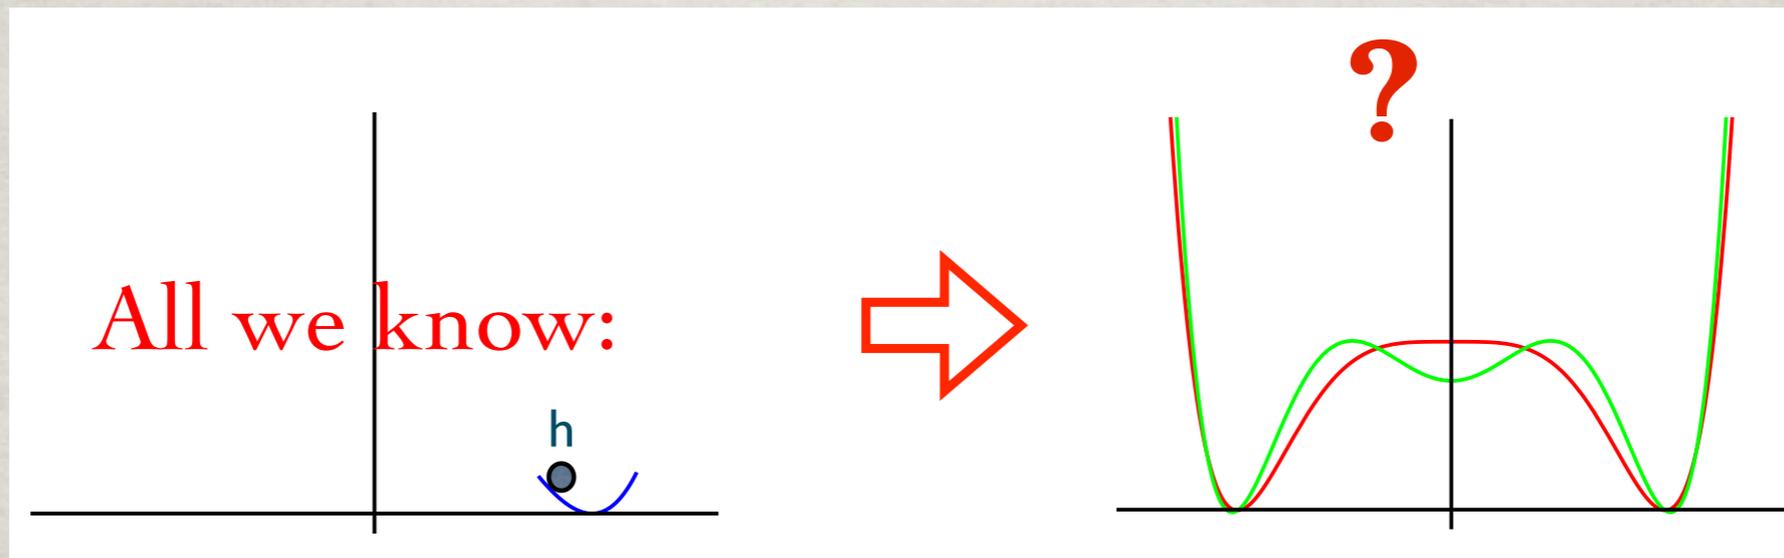

$$v = (\sqrt{2}G_F)^{-1/2} \approx 246 \text{ GeV} \quad m_H \approx 126 \text{ GeV}$$

$$m_H^2 = 2\mu^2 = 2\lambda v^2 \quad \Rightarrow \quad \mu \approx 89 \text{ GeV}, \quad \lambda \approx \frac{1}{8}.$$

It is a weakly coupled new force,  
underwent a 2<sup>nd</sup> order phase transition.

Is there anything else?

# Question 1: The Nature of EWSB ?

With new physics near the EW scale:

$$V(h) \rightarrow m_h^2(h^\dagger h) + \frac{1}{2}\lambda(h^\dagger h)^2 + \frac{1}{3!\Lambda^2}(h^\dagger h)^3; \rightarrow \lambda_{hhh} = (7/3)\lambda_{hhh}^{\text{SM}}$$

$$\rightarrow \frac{1}{2}\lambda(h^\dagger h)^2 \log \left[ \frac{(h^\dagger h)}{m^2} \right] \rightarrow \lambda_{hhh} = (5/3)\lambda_{hhh}^{\text{SM}}$$

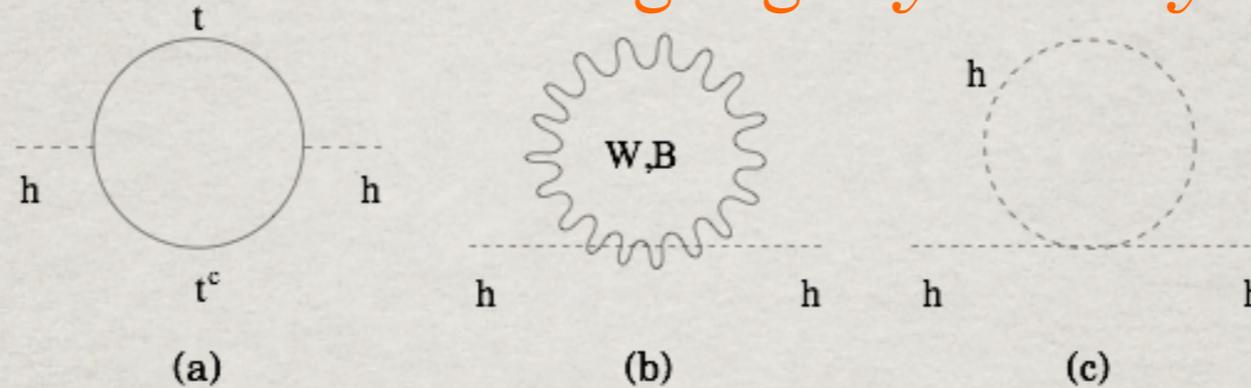

$\lambda(h^\dagger h)^2$  term could be made “-”:

leading to EW phase transition strong 1<sup>st</sup> order!

$\rightarrow O(1)$  deviation on  $\lambda_{hhh}$

# Question 2: The “Naturalness”

“... scalar particles are the only kind of free particles whose mass term does not break either an internal or a gauge symmetry.” Ken Wilson, 1970

$$m_H^2 = m_{H0}^2 - \frac{3}{8\pi^2} y_t^2 \Lambda^2 + \frac{1}{16\pi^2} g^2 \Lambda^2 + \frac{1}{16\pi^2} \lambda^2 \Lambda^2$$

If  $\Lambda^2 \gg m_H^2$ , then unnaturally large cancellations must occur.

The Higgs mass fine-tune:

$$\delta m_H / m_H \sim 1\% (1 \text{ TeV} / \Lambda)^2$$

Natural:  $O(1 \text{ TeV})$  new physics, associated with  $ttH$ .

Unknown: Deep UV-IR correlations?

Agnostic: Multiverse/anthropic?

“Naturalness” in perspective:

Unbelievable!

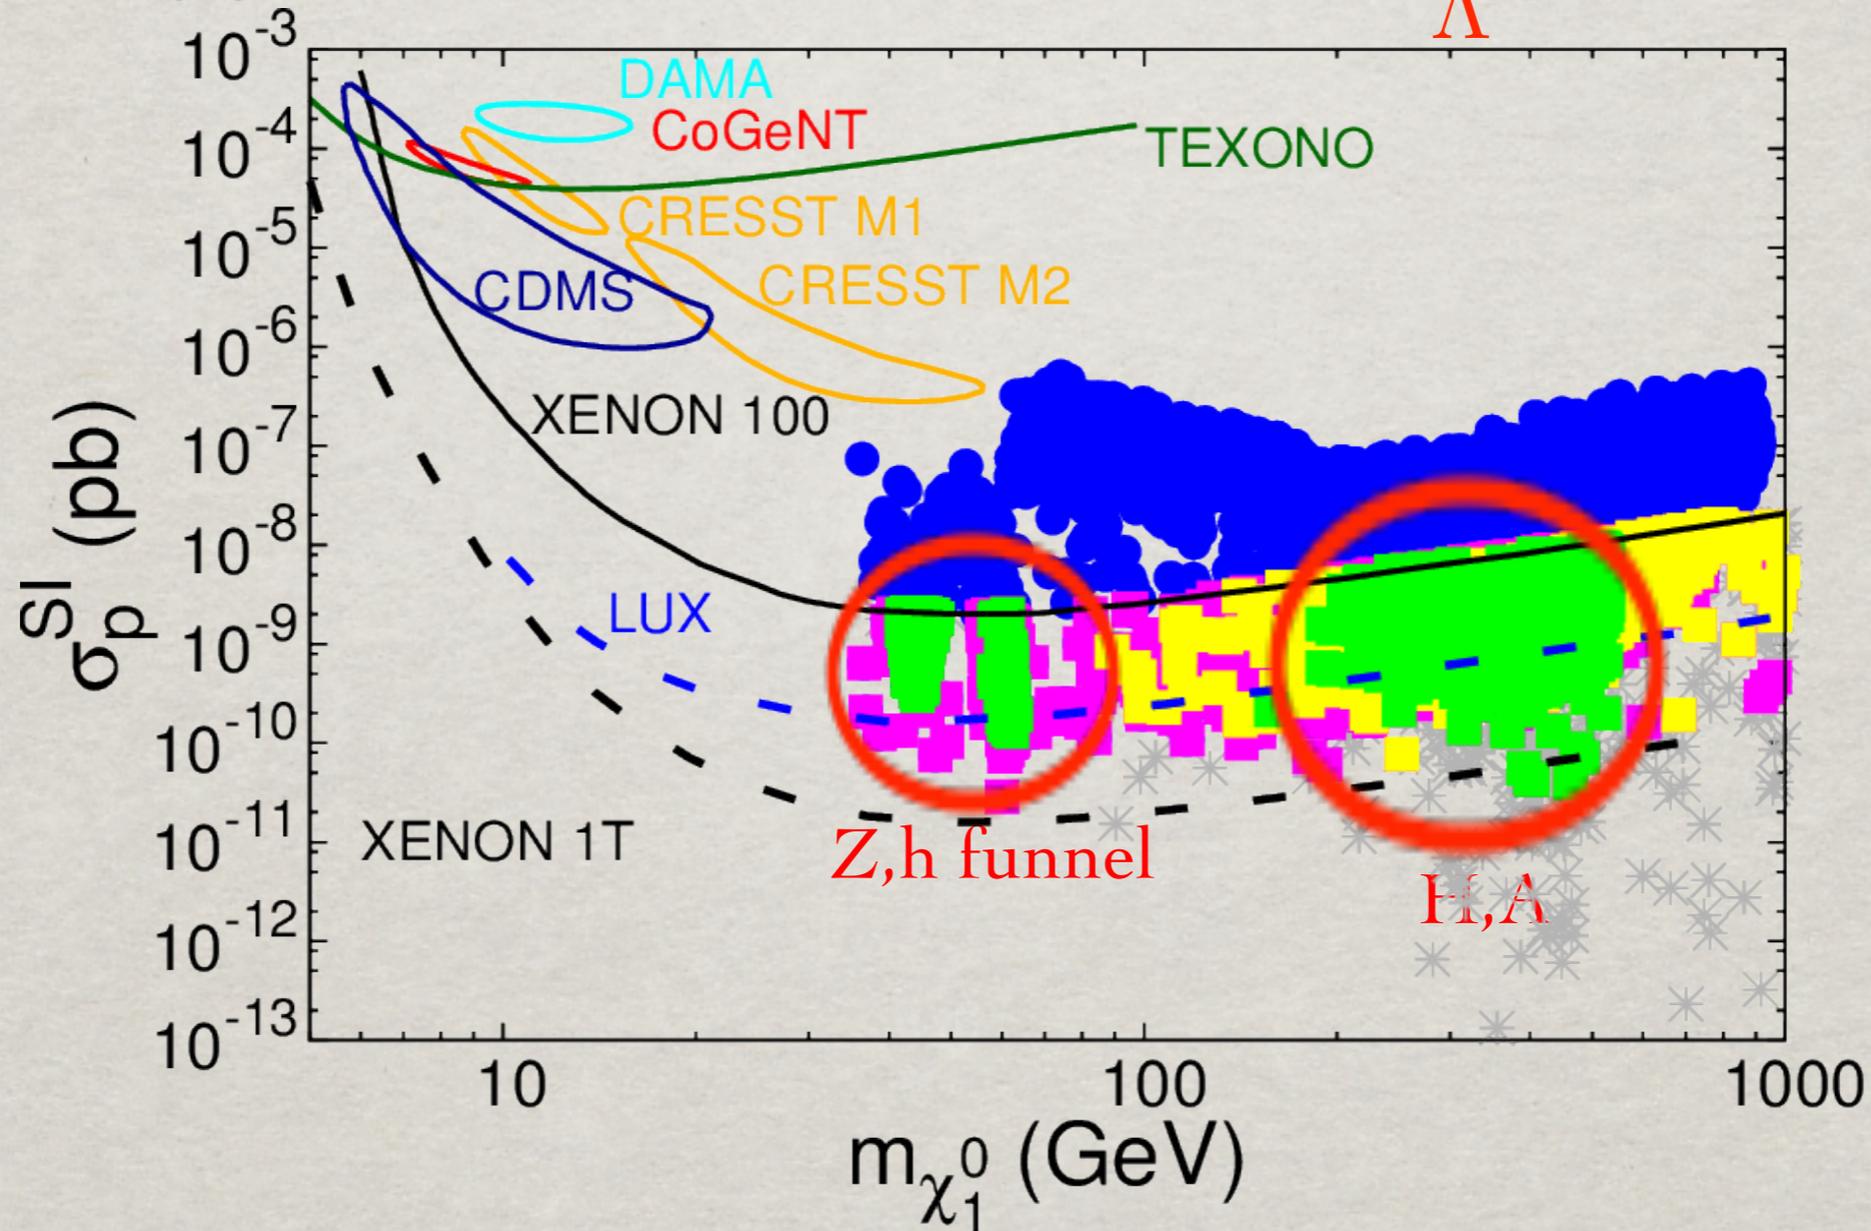

$4 \text{ mm}^2 / 20 \text{ cm}^2 \sim 10^{-3}$  fine-tune.

“Naturalness”  $\rightarrow$  TeV scale new physics.

# Question 3: The Dark Sector

The un-protected operator may reveal secret

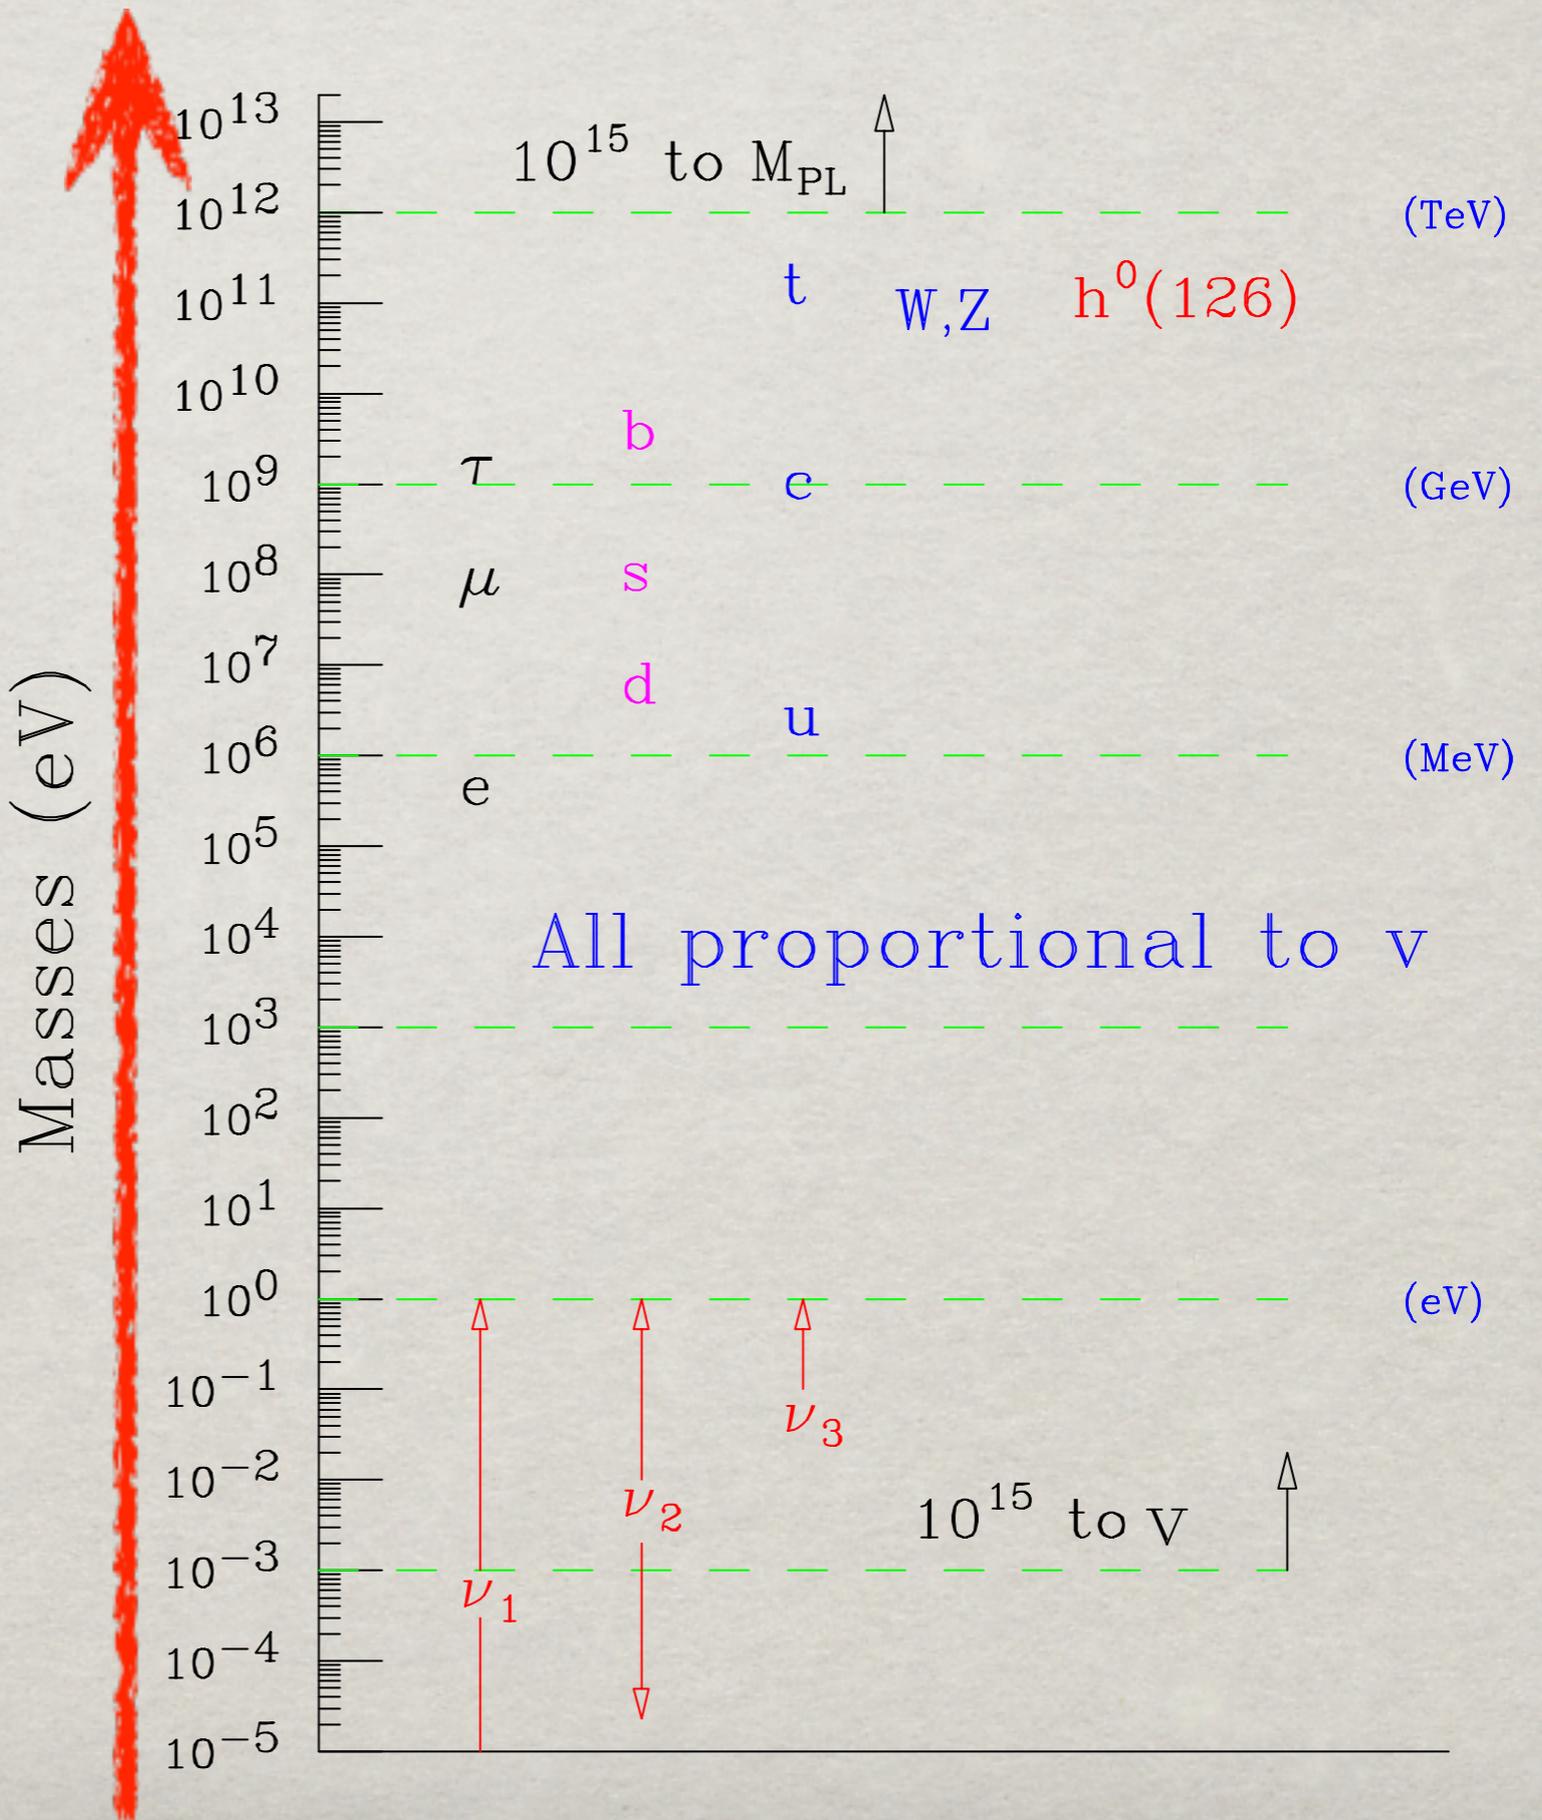

**Higgs portal:**  $k_s H^\dagger H S^* S$ ,  $\frac{k_\chi}{\Lambda} H^\dagger H \bar{\chi} \chi$ .

# Question 4: The “Flavor Puzzle”

- Particle mass hierarchy
- Patterns of quark, neutrino mixings
- New CP-violation sources?

Higgs Yukawa couplings as the pivot!

# The Higgs as pivot for “seesaw”:

$$m_\nu \sim \kappa \frac{\langle H^0 \rangle^2}{M}$$

Type I seesaw:  $M = M_N$ , right-handed (sterile)  $N_R^i$

$$H \rightarrow NN, N \rightarrow H\nu, \dots$$

Type II seesaw:  $M = M_{H^{++}}$ , a Higgs triplet  $\Phi_3$

$$H^{++} \rightarrow l_i^+ l_j^+$$

Type III seesaw:  $M = M_T$ , a fermionic triplet  $T_3$ :

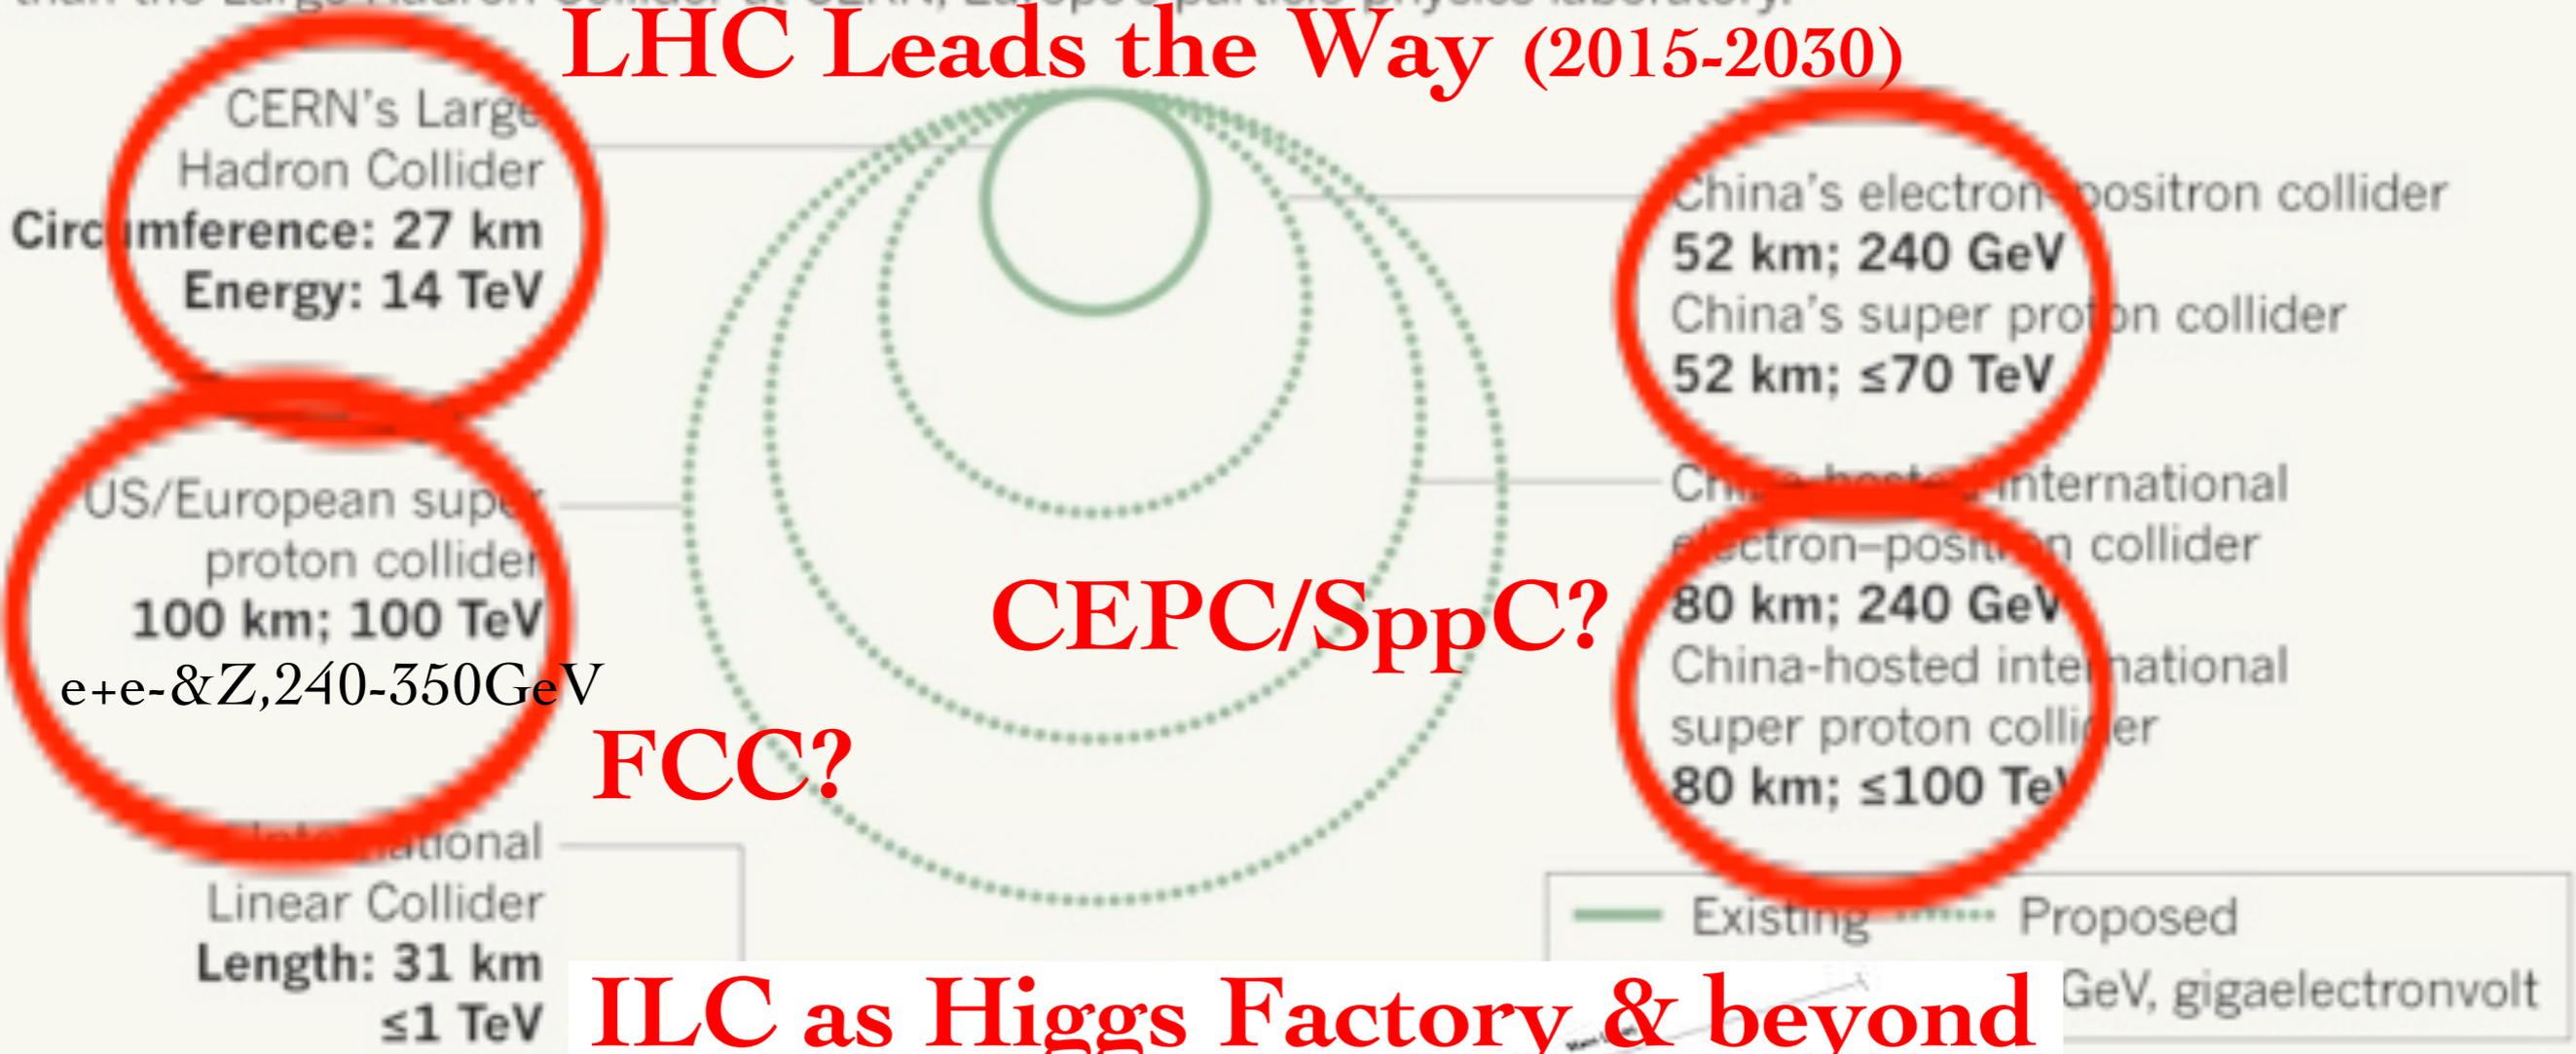

$$T^+ \rightarrow H l_i^+, T^0 \rightarrow W^\pm l$$

Watch out:  $H^0 \rightarrow \mu\tau (l_i^+ l_j^-)$  for BSM flavor physics!

# COLLISION COURSE

Particle physicists around the world are designing colliders that are much larger in size than the Large Hadron Collider at CERN, Europe's particle-physics laboratory.

## LHC Leads the Way (2015-2030)

## ILC as Higgs Factory & beyond

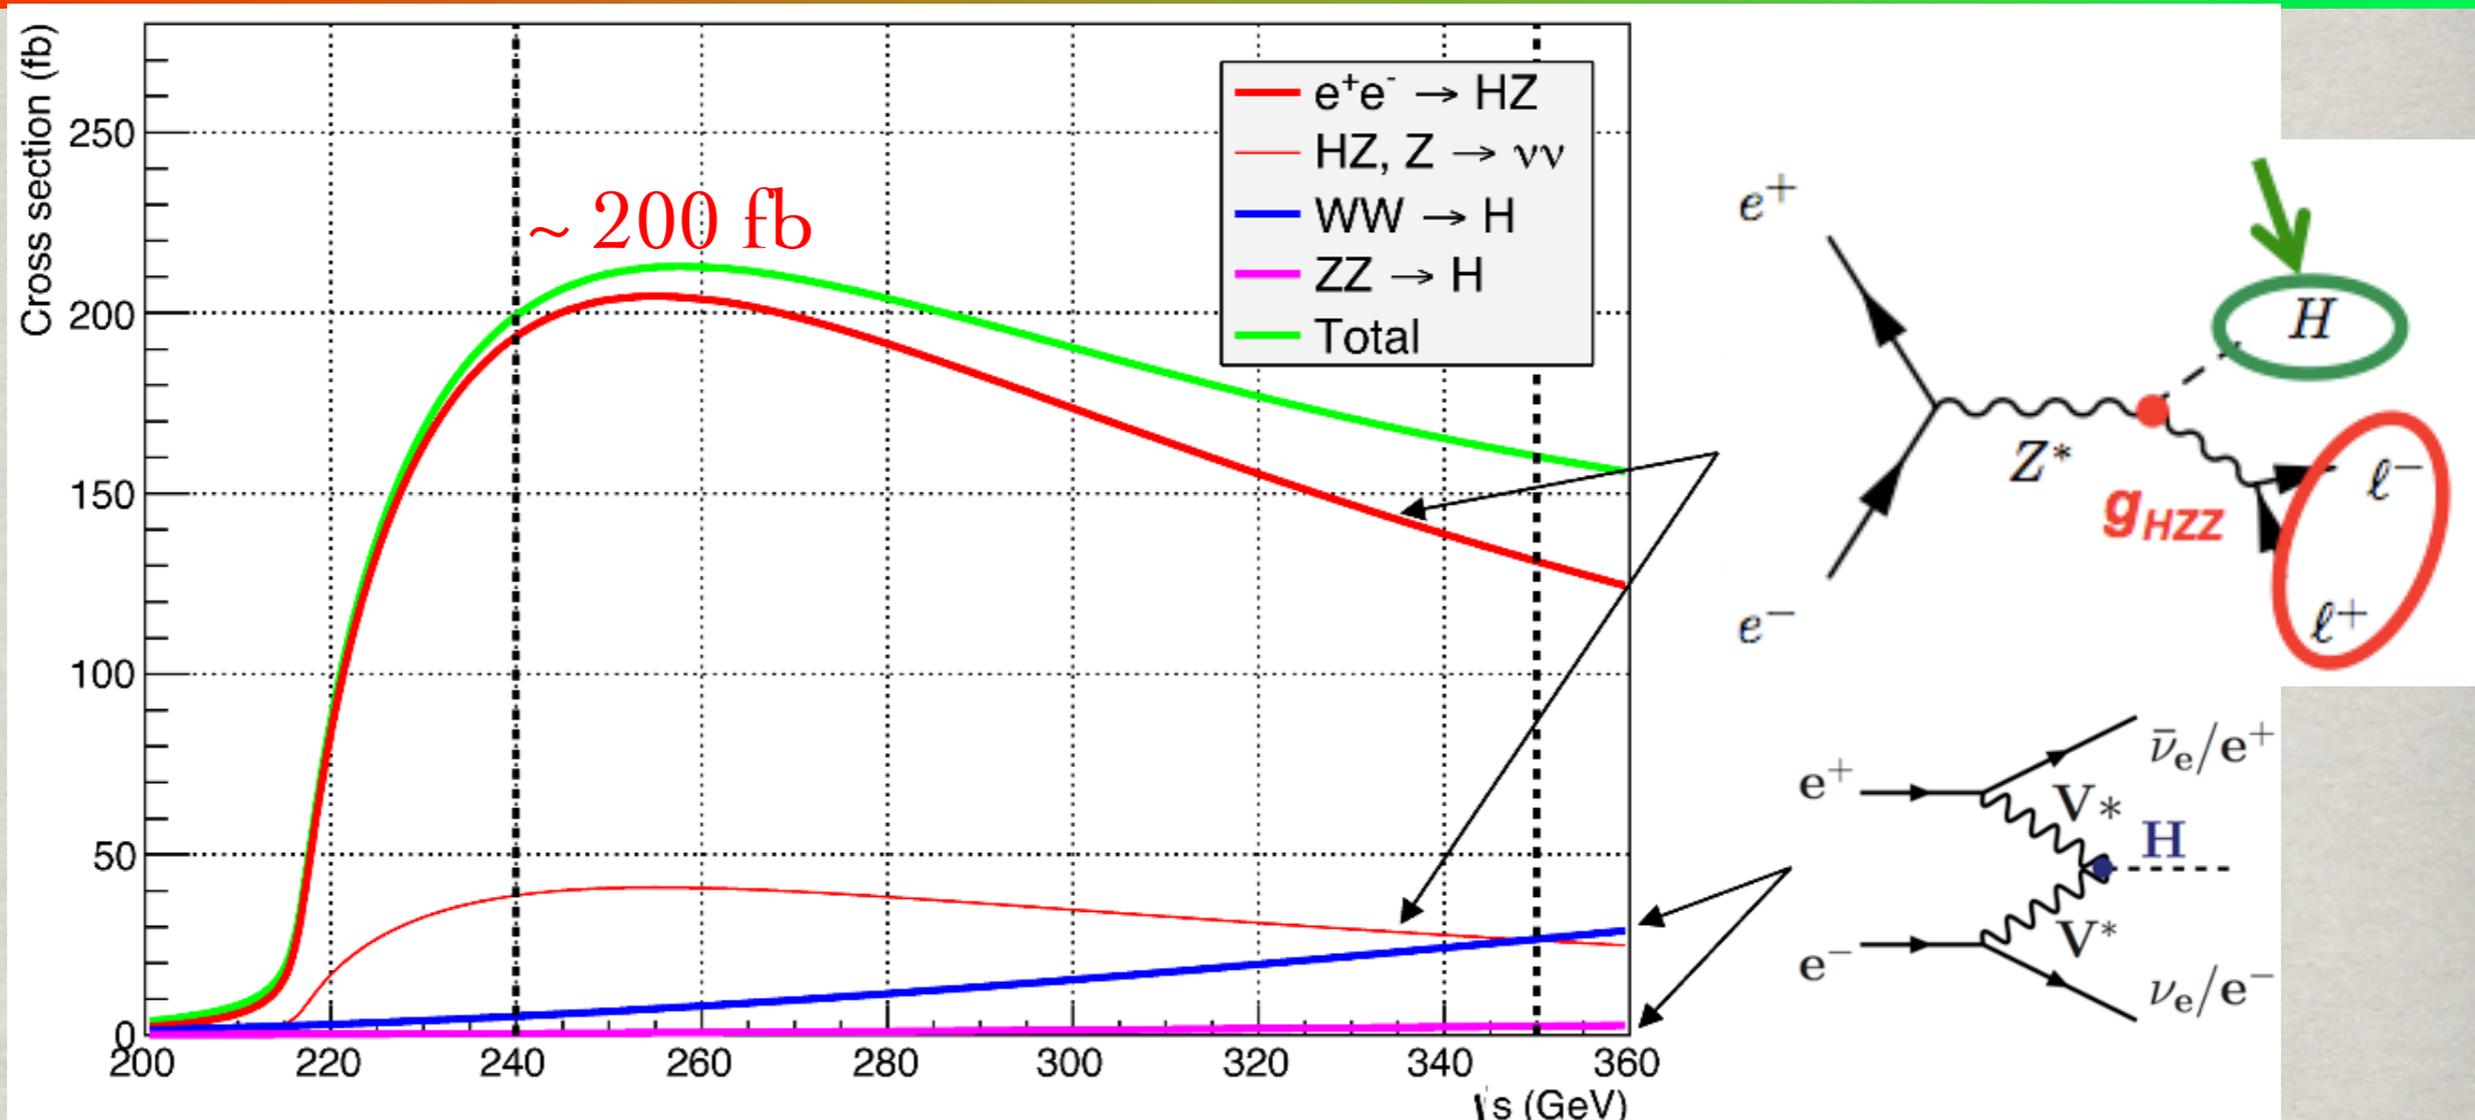

**Table 1-1.** Proposed running periods and integrated luminosities at each of the center-of-mass energies for each facility.

# Heavy Higgs bosons: $H^0, H^\pm$

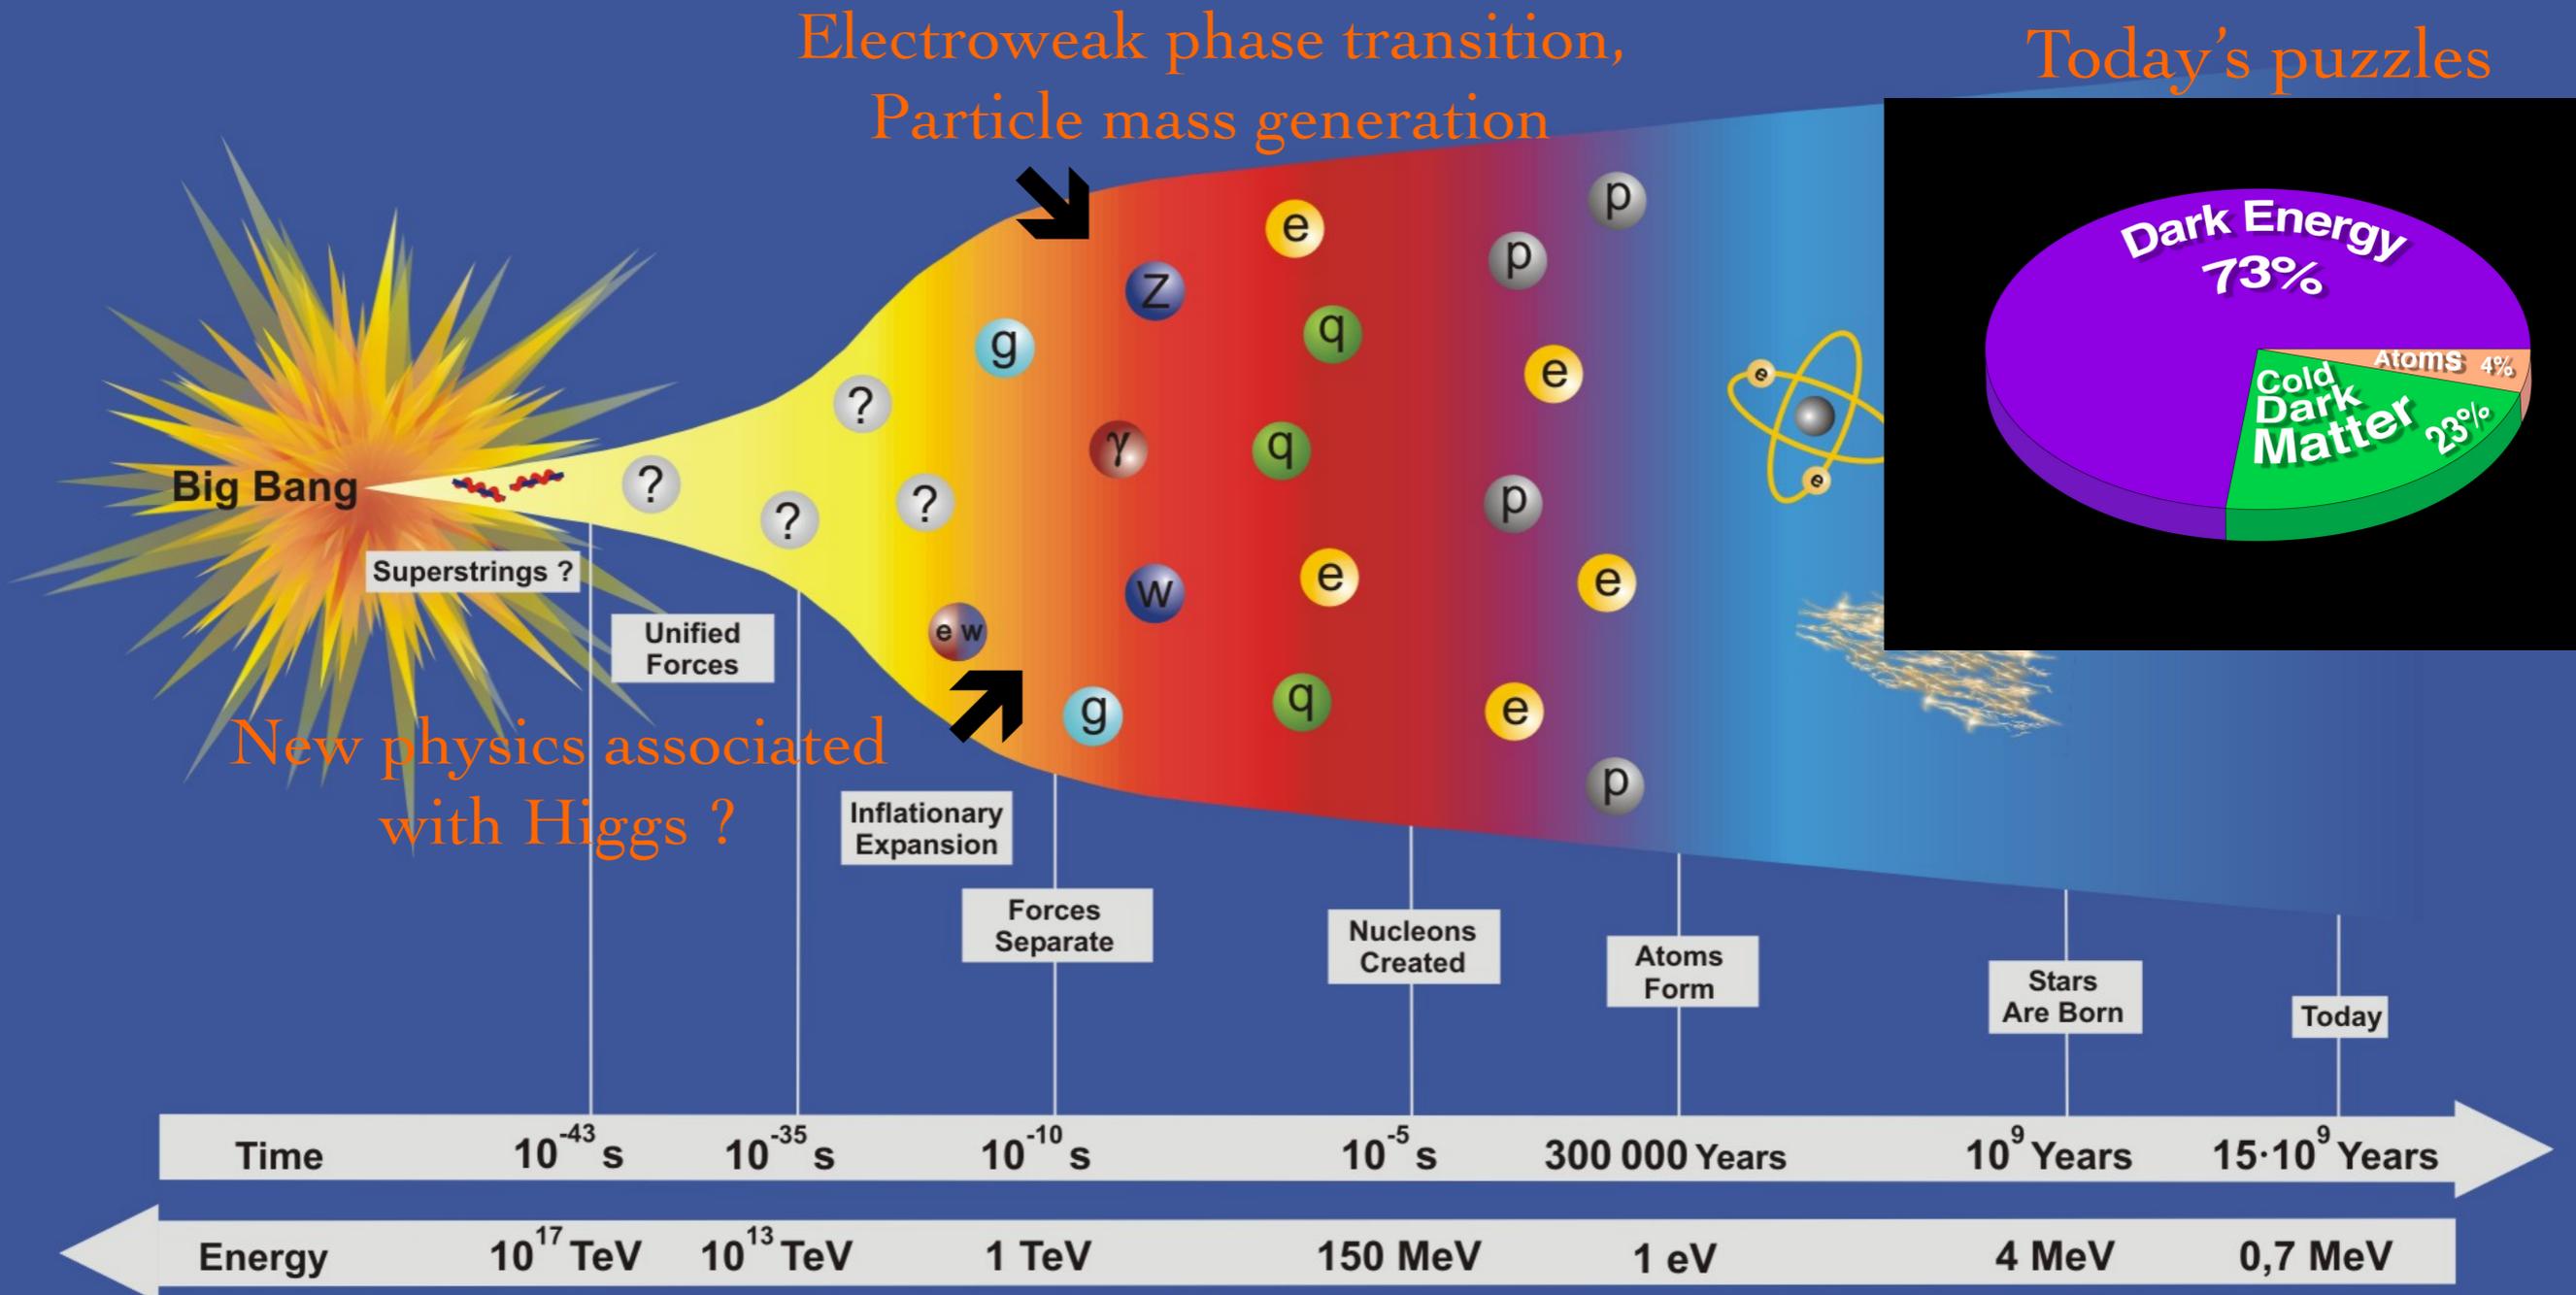

## New (vector-like) leptons

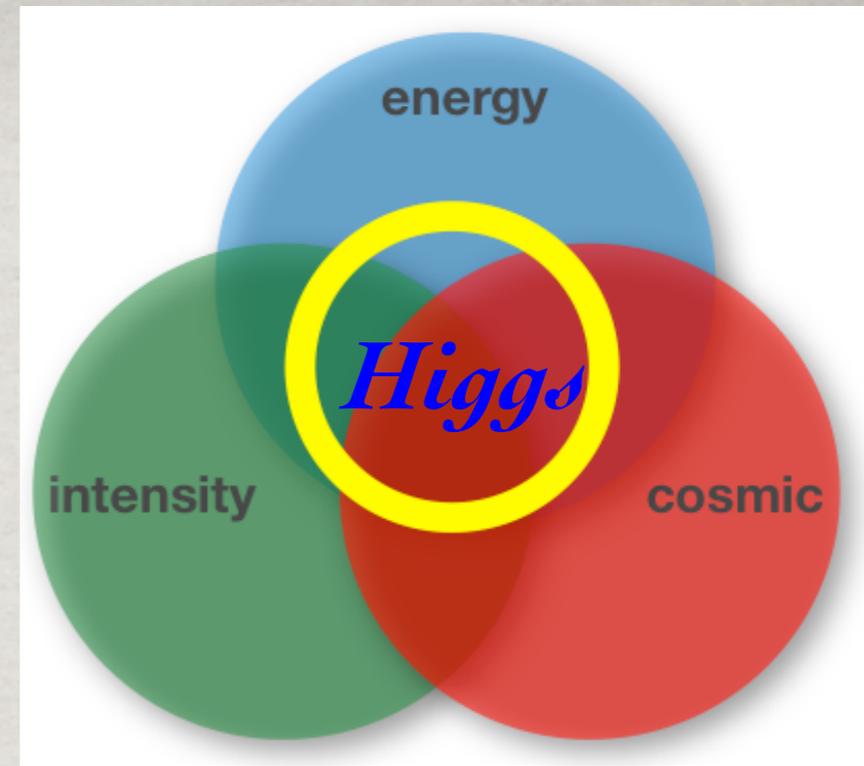

Mass reach at 100 TeV:  
 $\sim 5x$  over LHC

# A GRAND PICTURE:

# Summary:

- The Higgs boson is a new class, at a pivotal point of energy, intensity, cosmic frontiers.

“Naturally speaking”:

It should not be a lonely solitary particle.

- Precision Higgs physics:

LHC lights the way:  $g \sim 10\%$ ;  $\lambda_{HHH} \sim 50\%$ ;  $\text{Br}_{\text{inv.}} \sim 20\%$

Higgs factory/SppC:  $g \sim 1\%$ ;  $\lambda_{HHH} < 10\%$ ;  $\text{Br}_{\text{inv.}} \sim 2\%$ ;  $\Gamma_{\text{tot}} < 6\%$

- CEPC/SppC New physics reach:

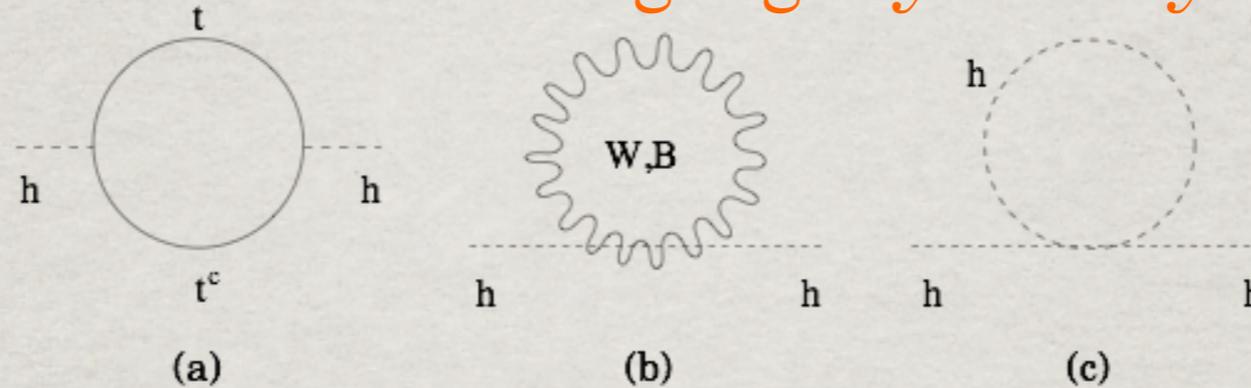

6x LHC reach: 10 – 30 TeV  $\rightarrow$  fine-tune  $< 10^{-4}$

WIPM DM mass  $\sim 1 - 5$  TeV

**An exciting journey ahead!**

# Question 2: The “Naturalness”

“... scalar particles are the only kind of free particles whose mass term does not break either an internal or a gauge symmetry.” Ken Wilson, 1970

$$m_H^2 = m_{H0}^2 - \frac{3}{8\pi^2} y_t^2 \Lambda^2 + \frac{1}{16\pi^2} g^2 \Lambda^2 + \frac{1}{16\pi^2} \lambda^2 \Lambda^2$$

If  $\Lambda^2 \gg m_H^2$ , then unnaturally large cancellations must occur.

Cancelation in perspective:

$$\begin{aligned} m_H^2 &= 36,127,890,984,789,307,394,520,932,878,928,933,023 \\ &\quad - 36,127,890,984,789,307,394,520,932,878,928,917,398 \\ &= (125 \text{ GeV})^2 ! ? \end{aligned}$$

Natural:  $O(1 \text{ TeV})$  new physics, associated with  $ttH$ .

Unknown: Deep UV-IR correlations?

Agnostic: Multiverse/anthropic?
